J. P. YODER, *Secretary.*

LETTER OF TRANSMITTAL.

FEDERAL TRADE COMMISSION,
Washington, D. C., August 21, 1919.

SIRS: I have the honor to transmit herewith a report on the leather and shoe industries in part covering the period from 1914 to 1917, inclusive, and in part covering the period from 1914 to 1918.

By direction of the commission:

Yours, very truly,

VICTOR MURDOCK,
Acting Chairman.

To the PRESIDENT OF THE SENATE AND THE
SPEAKER OF THE HOUSE OF REPRESENTATIVES.

III

381604

ACKNOWLEDGMENT.

AUGUST 21, 1919.

In the direction of the investigation and the preparation of the report especial acknowledgment is made by the commission to Mr. T. M. Robertson.

LETTER OF TRANSMITTAL	III
SUMMARY	1
CHAPTER I. INTRODUCTION.	
Section 1. Origin of this investigation	7
2. Scope of investigation	7
3. Manner of conducting the investigation	8
4. Names of companies not shown in connection with statistical tables	9
CHAPTER II. THE HIDE MARKET.	
Section 1. Distinction between country hides and packer hides	10
2. Method of marketing country hides	10
3. Prices of hides	11
Parity of prices of packer and country hides	12
Prices of hides at Chicago for five years	13
4. Gross profits of dealers in country hides	14
CHAPTER III. COSTS AND PROFITS OF TANNERS.	
Section 1. Introduction	20
2. Cost of producing sole leather	21
3. Cost of producing upper leather	23
4. Increased costs in 1918	25
5. Investment and earnings in the tanning business	26
Rates of earnings on investments of 50 tanning companies grouped according to amount of investments, 1914–1917	28
CHAPTER IV. COSTS AND PROFITS OF SHOE MANUFACTURERS.	
Section 1. Introduction	30
2. Cost of producing shoes	31
Men's shoes	32
Cost of leather	32
Other materials	35
Labor cost	38
Overhead expense	41
Women's shoes	44
Cost of leather	44
Materials other than leather	47
Labor cost	50
Overhead expense	53
Misses' shoes	56
Children's and infants' shoes	61
Children's shoes	61
Infants' shoes	66
Comparisons of details of cost with total cost, 1914–1917	71
3. Comparison of total costs, selling prices, margins of manufacturers, and increase in costs and selling prices, 1914–1918	74
Margins between costs and selling prices	75
Comparisons of increases in costs and selling prices, 1914–1918	84
4. Investment and earnings of shoe manufacturers	99

CHAPTER V. MARGINS AND PROFITS OF SHOE DEALERS. Page.
Section 1. Introductory 105
2. Margins and profits of wholesale dealers 105
3. Margins and profits of retail dealers 124
4. Cost of doing business 153
5. Profits of dealers 154

CHAPTER VI. GENERAL CONDITIONS IN THE LEATHER AND SHOE INDUSTRIES AND CONCLUSIONS OF THE COMMISSION.

I. THE HIDE BUSINESS.

Section 1. Competitive conditions in the country-hide trade 156
2. Control of packer hides 158

II. THE LEATHER INDUSTRY.

Section 3. Evolution of the tanning industry 159
4. Organization of the industry to-day 160
5. Concentration in the industry 161
6. The meat packers as a competitive factor in the leather industry 163
7. Accounting methods of the tanners 165

III. THE SHOE INDUSTRY AND THE SHOE TRADE.

Section 8. Centralization in the industry 166
9. Competitive conditions in the industry 167
10. Methods of distribution 167
11. Effect of styles on prices 168
12. Comparative quality of shoes in 1914 and 1917 170

IV. CONCLUSIONS.

Section 13. Importance of a better system of handling and marketing country hides 171
14. Economies possible in the shoe manufacturing business 172
15. Desirability of uniform and better accounting methods 174
16. The causes of the advance in the price of shoes and a comparison of these advances with profits 177

LIST OF TABLES.

	Page.
1. Comparative prices of packer hides at Chicago for 10 years, weeks ending Feb. 2 and Aug. 3	12
2. Comparative prices of country hides at Chicago for 10 years, weeks ending Feb. 2 and Aug. 3	12
3. Cost and selling prices of country hides and margins of gross profit of hide dealers, 1914–1918	15–18
4. Comparative cost of producing sole leather, years 1914, 1916, 1917	22
5. Comparative cost of producing upper leather, years 1914, 1916, 1917	24
6. Comparative cost of producing upper leather, years 1914, 1916, 1917	25
7. Rates of earnings on investment in the tanning industry, 1914–1917	27
8. Comparison of cost of leather in men's shoes, per pair, 1914–1918	33–34
9. Comparison of cost of materials other than leather in men's shoes, per pair, 1914–1918	36–37
10. Comparison of cost of labor in men's shoes, per pair, 1914–1918	39–40
11. Comparison of overhead expenses in men's shoes, per pair, 1914–1918	42–43
12. Comparison of cost of leather in women's shoes, per pair, 1914–1918	45–46
13. Comparison of cost of materials other than leather in women's shoes, per pair, 1914–1918	48–49
14. Comparison of cost of labor in women's shoes, per pair, 1914–1918	51–52
15. Comparison of overhead expense in women's shoes, per pair, 1914–1918	54–55
16. Comparison of cost of leather in misses' shoes, per pair, 1914–1918	57
17. Comparison of cost of materials other than leather in misses' shoes, per pair, 1914–1918	58
18. Comparison of cost of labor in misses' shoes, per pair, 1914–1918	59
19. Comparison of overhead expenses in misses' shoes, per pair, 1914–1918	60
20. Comparison of cost of leather in children's shoes, per pair, 1914–1918	62
21. Comparison of cost of materials other than leather in children's shoes, per pair, 1914–1918	63
22. Comparison of cost of labor in children's shoes, per pair, 1914–1918	64
23. Comparison of overhead expense in children's shoes, per pair, 1914–1918	65
24. Comparison of cost of leather in infants' shoes, per pair, 1914–1918	67
25. Comparison of cost of materials other than leather in infants' shoes, per pair, 1914–1918	68
26. Comparison of cost of labor in infants' shoes, per pair, 1914–1918	69
27 Comparison of overhead expenses in infants' shoes, per pair, 1914–1918	70
28. Comparison of details of cost with total cost per pair, 1914 and 1917	72–73
29. Manufacturers' costs, selling prices, and margins of gross profits per pair, men's shoes, 1914–1918	76–77
30. Manufacturers' costs, selling prices, and margins of gross profits per pair, women's shoes, 1914–1918	78–79
31. Manufacturers' costs, selling prices, and margins of gross profits, per pair, misses' shoes, 1914–1918	80
32. Manufacturers' costs, selling prices, and margins of gross profits per pair, children's shoes, 1914–1918	81–82

REPORT ON LEATHER AND SHOE INDUSTRIES.

SUMMARY.

This report treats of conditions in the leather tanning industry, including the hide trade, and the boot and shoe industry, including the merchandising of shoes. The period covered by the inquiry is from 1914 to 1918, inclusive, except in regard to certain financial data. The outstanding facts established by the inquiry are as follows:

(1) Between 1914 and 1917 the prices of hides, the principal factor in the cost of producing leather, greatly advanced and the differential between country hides and packer hides increased beyond the usual proportion, due to the more marked increase in the price of packer hides.

(2) Though there was an increase in the cost of hides to the tanner, the prices of his product—leather—advanced to a point that could not be justified by the cost of producing it. This conclusion is supported by the high rates of return on investment received by tanners.

(3) The cost of manufacturing shoes increased greatly between 1914 and 1917, but, as evidenced by the high rates of return on investment, not to an extent that warranted the prices at which manufacturers sold their product.

(4) The absolute margins of profit taken by retail shoe merchants per pair of shoes grew wider as their costs of shoes increased, because their rate of profit remained substantially without change.

(5) As a result the public had to pay prices for shoes that could not be justified, not only because retail shoe dealers took too much profit but because the dealer had to pass on to the consumer the excessive profits received by butchers for hides, and also the excess profits of tanners and shoe manufacturers.

GENERAL CONDITIONS.

During the progress of the war in Europe, even before the United States became a belligerent, the demand for leather and leather goods for the allied nations of Europe had a marked effect on prices. The demand was not only for large quantities of leather and shoes, but there was pressure for quick delivery. Either one of these factors would tend to stimulate prices, and both of them together brought rapid and marked advances in the prices of both leather and shoes, and also of hides and skins.

When the United States entered the war, there was immediate demand for shoes and other equipment made of leather to meet the requirements of the Army. The shoes needed by the Government were required to be made of specified high-grade leather. Only the better grades of hides could be used in making such leather, and as a result hides, especially the better grades, rapidly advanced in price. The situation became so acute that in 1918 the War Industries Board undertook to provide means of supplying the tanners with hides at fixed maximum prices. Maximum prices for leather were also fixed for the shoe manufacturers. The demand for labor in other industries compelled tanners and shoe manufacturers to increase wages.

THE HIDE MARKET.

There are two well-recognized classes of domestic hides, i. e., packer hides and country hides. Packer hides include those taken from cattle in regular slaughtering establishments, while country hides include all others, such as are taken off by small butchers and by farmers. The quality of country hides, as a class is generally considered not as good as packer hides, and there has always been a differential in price in favor of the latter.

Between 1914 and 1917, there was a remarkable advance in the prices of hides. From 1914 to 1917 the price of heavy native packer cowhides advanced more than 68 per cent, while the corresponding grade of country hides increased less than 42 per cent. The actual increase in price of packer and country cowhides in the two years was 13 cents and 7 cents per pound, respectively. A comparison of these actual increases with the percentage of increase indicates that the differential between packer hides and country hides widened beyond the usual proportion.

More than 75 per cent of the cattle and 65 per cent of the calves killed by wholesale slaughterers in the United States are killed by five large meat packers. The best hides are taken off by these wholesale slaughtering concerns and the cattle killed by the five large packers are uniformly heavier than those killed by the smaller ones. These five large meat-packing concerns thus have a high degree of control of the grades of domestic hides that are reputed to produce the best grades of leather. Somewhat less than half of the hides used by the tanners of the United States are imported. Four of these five large packers produce a large proportion of the cattle hides that are available for import into this country. In those classes of hides that enter into the production of the lighter leathers there is not the same degree of control in the hands of packers as in the heavier grades, yet some of these same packers are very important factors in the country hide trade. Taking into account the extent to which these five large meat packers control the domestic hides, the extent to which

Digitized by Google

they control the hides that are available for import, and the extent to which some of them are engaged in the country hide business, and taking also into account the extent to which they are engaged in the tanning business, they seem to be in a position largely to control the hide market.

The system of handling and marketing country hides is not satisfactory. The farmer, and often the small butcher, usually sell their hides without grading. As a consequence of this method of purchasing hides from the primary owner, it is often the case that no distinction is made between those hides that are well taken off and well cured and those that are not.

THE TANNING INDUSTRY.

During the four years, 1914 to 1917, the cost of producing sole leather increased from 9 to more than 20 cents per pound of leather produced. About 85 per cent of the increase was due to the increased cost of hides. The increase in cost other than for materials, including overhead expenses, during four years ranged from about 1½ cents to 3 cents per pound of leather produced. For upper leather the increase in the conversion cost between 1914 and 1917 was, in some cases, as much as 100 per cent, though the total cost of producing this class of leather, including the cost of the hides, was approximately only 70 per cent. The cost of producing kip upper leather, including the cost of the hides, increased during the four years about 75 per cent, while the cost of producing calf leather increased a little more.

The earnings on investment in the tanning business were very much greater in 1916 and 1917 than they were in 1914 and 1915. The poorest results were in 1914. Of 53 representative companies, 24 earned less than 10 per cent in 1914, and 11 had earnings of over 20 per cent, while none earned as much as 40 per cent. In 1917 only 2 of the 53 companies earned less than 10 per cent, 32 earned over 20 per cent, and 9 earned over 40 per cent.

THE SHOE MANUFACTURING INDUSTRY.

There was a great increase in the cost of producing shoes between 1914 and 1917, the principal increase being in the cost of leather. Between 1914 and 1917 the cost of leather increased from 40 to 100 per cent—in a majority of shoes the increase was over 50 per cent. The cost of materials other than leather, such as linings, trimmings, cartons, and packing cases, increased at approximately the same rate as leather. Labor and general expense did not increase at so great a rate as either leather or other materials. There was but little difference in the rate of increase in the various elements of cost

of shoes except for misses' shoes, which had a greater increase in leather cost than any other class, and children's and infants' shoes, which had a greater increase in cost for materials other than leather. It should be noted in this connection that leather constituted from 50 to 70 per cent of the total cost of all classes of shoes in 1914, except infants', and by 1917 this percentage had increased to about 60 to 75 per cent.

The manufacturers' selling prices of shoes increased at a somewhat greater rate than costs. In 1918 costs in many instances were less than 1917, but reductions in selling prices occurred in only about half of the shoes showing reduced costs.

The rate of return on investment was much greater in 1916 and 1917 than in 1914 and 1915. Out of 236 companies where comparisons could be made for these years, 23 had losses in 1914. By 1916 earnings had increased until there were only 3 companies with losses, and in 1917 there were 8. There were 102 companies out of 236 that had earnings of 15 per cent or more in 1914, while in 1917 there were 169 companies in this class. More than one-third of the companies here considered earned 25 per cent or more in 1917, while only about one-sixth earned this much in 1914. Of 236 companies 104 earned 25 per cent or more in 1916.

SHOE MERCHANDISING.

The gross profits of wholesale shoe merchants generally ranged above 20 per cent of the cost and they were somewhat greater in 1918 than in previous years.

There was a heavy increase in the price of shoes to consumers between the years 1914 and 1918. The retailers' gross profit is around 50 per cent—sometimes more and occasionally less. In 1914, the retail merchants' rate of profit was somewhat lower than it was in 1918. The absolute amount of profit per pair of shoes was very much greater in 1918 than in 1914. A good work shoe for men that cost the dealer $1.75 in 1914 and retailed for $2.50, cost him $2.75 in 1918 and retailed for $4. In this instance the retailer took a margin of 75 cents in 1914, or 42 per cent, and in 1918 a margin of $1.25, or 45 per cent. In a group of shoes that cost from $2 to $2.50 in 1914, a large proportion of them retailed for $3.50 with a percentage of gross profit ranging from 40 to 64 per cent. The same shoes in 1918 cost the retailer from $3.05 to $4.45 per pair and retailed at from about $5 to as high as $7 per pair, with a gross profit ranging from 39 to 69 per cent. In 1914 the retailers' absolute gross profit for this group averaged a little more than $1 per pair, while in 1918 it averaged more than $1.80 per pair.

The absolute amount of money necessary to conduct business in 1917 and 1918 was greater than in 1914, but the relative cost of

doing business practically did not change. The percentage of total sales of dealers that was expended for the conduct of business was approximately the same in 1917 and 1918 as it was in 1914. The volume of business of more than 50 wholesalers increased 32 per cent in four years while their actual expenses in dollars and cents increased only 24 per cent. The actual expense of 53 retailers handling a general line of good shoes was 26 per cent of their sales in 1914, and the expense of 61 dealers in 1917 was the same. Stores handling popular-priced shoes had a lower rate of expense as compared with sales than the general class of dealers. It is to be noted also, these popular-price stores had a lower rate of expense in 1918 than they had in years prior to that time.

RETAIL PRICE OF SHOES.

Taking into consideration all the circumstances, the high prices of shoes in 1917 and 1918 can not be justified. Leather manufacturers, shoe manufacturers, and retail shoe merchants all made unprecedented profits.

It should be noted in this connection that prices were bound to advance considerably between 1914 and 1917, even though no large profits were obtained. There was an increase in the cost of hides and all other materials used in the manufacture of leather. The shoe manufacturer had to pay much higher prices for leather and other materials and also more for labor as the war progressed. While the shoe merchant did not take a larger percentage of profit on the cost of shoes, the application of the same percentage during the war as was used prior thereto, gave him a much larger absolute profit per pair of shoes.

The best standard for judging whether or not the prices of a commodity are reasonable is the percentage of the profit on the investment employed in its production and sale. Measured by this standard slaughterers took more than they should for hides, tanners charged more for leather than they should, and shoe manufacturers likewise charged too much for shoes. Even in 1914 the tanning industry was prosperous; in perhaps a majority of cases earnings were 10 per cent or more and only a very few suffered losses. By 1916 and 1917 it was rather unusual for a company to earn less than 20 per cent. A similar comparison for manufacturers of shoes shows that more than twice as many made a profit of 20 per cent or more in 1916 and 1917 as did in 1914.

The rate of return on investment to shoe merchants can not be stated, but it is evident from the volume of business they had and from the gross margins of profit they secured per pair of shoes, that their business was very profitable. Taking into consideration all the circumstances, especially the circumstance that the United States

was engaged in war, the large profits taken by slaughterers for hides, by tanners and shoe manufacturers, and retail shoe dealers can not be justified, and there is consequently no justification for prices that consumers have been compelled to pay for shoes.

Some relief from the intolerable prices paid by consumers for shoes may be had by (1) a rigid enforcement of the laws against monopolistic control of commodities, (2) legislation forbidding producers of hides engaging in the tanning business, and (3) the adoption of a device in the distribution of shoes that will acquaint the consumer with the selling prices of the manufacturer.

CHAPTER I.

INTRODUCTION.

Section 1. Origin of this investigation.

During the latter part of 1917 there was general complaint about the high prices of shoes. At the same time complaints came from every section of the country concerning the low prices of country hides as compared with the prices of shoes and of packer hides. The prices of packer hides—that is, those taken off by the large slaughterers of the country—had advanced to a high figure. When the public complained of the high prices of shoes, the shoe manufacturers pointed to the high prices of leather and the tanners pointed to the high prices of hides. The farmer and the country hide dealer asserted that country hides, which constitute a large percentage of the domestic supply, were relatively lower in price than they were a year before. They directed attention to the fact that whereas country hides usually sold for 2, 3, or 4 cents per pound less than packer hides, they were then selling for 7, 8, and 10 cents less.

The Commission undertook to ascertain such facts as would enable it to determine, if possible, where to place the responsibility of the high prices of shoes and the low prices of country hides as compared with packer hides.

Section 2. Scope of investigation.

The report deals with the prices of hides, general conditions in the hide market, the prices of certain kinds of leather, profits in the tanning industry, and a limited discussion of the cost of tanning certain staple leathers; the cost of manufacturing shoes and the profits in the shoe manufacturing business; the cost and selling prices (wholesale and retail) of shoes; and general conditions in the hide, leather, and shoe business. Most of the information covers the period from 1914 to the end of 1917 and in a few cases extends into 1918.

In the course of another investigation the Commission found that some of the meat packers were largely engaged in tanning leather. In order to determine the extent of this packer interest in the leather business, a great mass of information was obtained from the tanning industry as a whole. The Commission thus had in hand considerable information that could be used as the basis for a general investigation. This information consisted largely of investment, earnings, and production in the tanning industry.

It was then planned to ascertain the cost of producing the principal kinds of leather; the cost of producing shoes; and to investigate conditions in the hide business and in the merchandising of shoes. This plan was put into execution in January, 1917, but soon thereafter the demands of the War Industries Board for special accounting work in connection with the tanning industry made it impossible promptly to carry out the plan of the general investigation. Compliance with these demands of the War Industries Board made it necessary to divert the accounting force from the general work to the special work for that board. This not only took the accountants who had been assigned to the cost work in connection with the tanning industry, but it also lessened the number that could be employed in connection with the inquiry into the shoe industry. The work of the general investigation was thus greatly delayed.

When the armistice was signed, November, 1918, the necessity for resuming the work of finding the cost of producing leather did not seem sufficiently pressing to warrant the large expenditure of money that would have been required. This position was strengthened by the fact that the Commission had sufficient information in regard to costs which considered in connection with fairly complete data for earnings on investment to enable it to reach sound conclusions.

A great deal of space might have been devoted to the technique of each branch of the business covered by the report. It has not seemed, however, that a discussion along these lines would be profitable here. In the final chapter of the report, however, reference is made to such trade customs as will enable the reader to understand how the various products are marketed.

A study of conditions in the hide market and in the merchandising of shoes was made along the lines originally planned, but it was also delayed because of the small force that was available.

Section 3. Manner of conducting the investigation.

All of the information secured was taken direct from the records of the companies except the statements of earnings and investment in the tanning business and similar statements from a portion of the shoe manufacturers. Special agents and examiners of the Commission called upon hide dealers and shoe merchants and obtained facts relating to these businesses. There were also obtained from scores of individuals engaged in these branches of business expressions of opinions as to the causes of any unsatisfactory conditions that existed. The accountants of the Commission secured from the books of many shoe manufacturers the cost of producing various styles and grades of staple shoes, the prices at which they had been sold, and the margin of profit realized. No effort was made to secure the cost of fancy or novelty products.

Section 4. Names of companies not shown in connection with statistical tables.

In order not to disclose the operations of any individual business, no names appear in any of the tables. Each corporation, copartnership, or person has been given a number, and the number so given is applied to each concern wherever it appears in a table. Separate series of numbers are used for hide and shoe dealers, tanners, and shoe manufacturers.

In descriptions of shoes all words have been omitted that might identify either the manufacturer making them or the merchant selling them.

CHAPTER II.

THE HIDE MARKET.

Section 1. Distinction between country hides and packer hides.

There are two general classes of domestic hides, viz, packer hides and country hides. The former class includes those taken from cattle in the regular slaughtering establishments, while the latter class includes all other hides such as are taken off in small butchering establishments and by farmers. The distinction between the two classes is well understood among dealers and tanners. It is universally recognized that as a class country hides are less valuable than packer hides. In accord with this accepted fact the former always sell for less than the latter.

The reasons for this difference are, first, and perhaps mainly, that in the larger and better organized slaughtering establishments men are more skilled in taking off hides without scarring or cutting, and, second, such establishments are better equipped for curing them. This does not mean that all country hides are defective on account of being poorly taken off or on account of being badly cured. Some country hides are just as good in every respect as the best packer hides, but this is not generally true and, as will appear later, as the trade is now conducted, it is not always practicable for buyers to grade hides at the time of buying them.

During the last two or three years the difference in price between packer and country hides widened until there was widespread complaint to the effect that this difference had reached a point that could not be justified by the difference in quality. In other words, the discrimination against country hides was alleged to be due to artificial causes. An extensive investigation of conditions in the country hide trade was made and the facts thus obtained are shown and discussed in this chapter.

Section 2. Method of marketing country hides.

As already stated, country hides include those taken off by farmers and small butchers. In some sections of the country large numbers of cattle in the aggregate are slaughtered for home or neighborhood consumption. In addition to this a considerable number of cattle die of disease and their hides are removed and sold. Hundreds, if not thousands, of small towns are at least partly supplied with fresh beef and mutton by local butchers and the hides taken from cattle so slaughtered are classed as country hides.

The farmer sells to a near-by merchant or to representatives of hide dealers who travel through the country and collect them. The

local butchers sometimes sell to hide dealers, who are in business on their own account or who buy for others. In certain centers are found large dealers who purchase from these local collectors. Sometimes the farmer or local butcher markets his hides immediately after taking them off and the purchaser salts and cures them. In other cases the farmer or small butcher salts and cures his hides before selling them.

It is customary for the large dealer to pay a flat price rather than to grade them and pay a different price for different grades. When thus accumulated, the hides are graded according to quality and weight. It is apparent that the prices the dealer is willing to pay when buying in round ungraded lots depend upon his judgment as to quality. The representative of the large dealer is likely to be more expert than the farmer or small butcher or small dealer, and if so, he naturally takes advantage of his expert knowledge. The result may be, and sometimes is, that the price paid is too low, but an examination of the records of a large number of dealers does not indicate that, as a class, they have taken undue advantage of those less skilled in judgment.

It is thus seen that before a country hide reaches the tanner it may pass through three or four hands. The original owner of the hide may sell to a local merchant, the local merchant sells to a small dealer, the small dealer sells to a larger dealer, who in turn sells to the tanner. If, under the circumstances, this were as economical a system of marketing as could be devised it necessarily follows that if each purchaser realizes even a small margin of profit, there must be quite a wide difference between the price paid to the farmer or small butcher and the price paid by the tanner.

Section 3. Prices of hides.

The prices of hides advanced greatly during the last five years. This has been particularly true of those classes of hides used in the production of the heavier kinds of leather. Since 1914 these increases in the prices of important classes have amounted to more than 50 per cent. Hide and Leather, a publication devoted to the interest of the hide trade and the tanning industry, publishes weekly comparative prices of the principal grades of hides at Chicago. While these figures may not always exactly represent the entire market, they indicate the trend and for comparative purposes they are regarded as reliable. Tables 1 and 2, compiled from Hide and Leather, are shown below. These tables show comparisons for two periods in the year, viz, February and August, and they also show comparisons of prices for packer hides and country hides, respectively. Table 1 shows the prices of packer hides and Table 2 the prices of country hides for the years 1909 to 1918, inclusive.

1918	22½	28	17½	25½	17½	21	16½	22	15½	17	33	39

Parity of prices of packer and country hides.—As heretofore indicated, the quality of country hides as a class is below that of packer hides and therefore a differential of price in favor of the latter obtains. There was apparently no complaint in regard to this difference in prices until the margin between the two classes of hides during the last two or three years widened until the actual difference in price was more than twice as great as that which had ordinarily prevailed.

From the foregoing tables it can be seen that the prices of heavy native packer steer hides in Chicago in February and August, 1909, were 15⅝ cents and 17 cents, respectively, and the prices of the same class of country hides on the same dates were 13¼ cents and 14⅞ cents, a difference of 2⅜ cents per pound in February and of 2⅛ cents per pound in August. On corresponding days in 1917 the respective prices of these hides were 31½ cents and 32 cents for packer and 23¾ cents and 26¼ cents for country hides, a difference of 7¾ cents and 5¾

cents in February and August, respectively. The reasonableness of this widening of the margin should not be determined by these absolute figures. The fairest available basis is the percentage that the price of country hides is of the price of packer hides. In 1909 country hides sold for 15 and 13 per cent below packer hides in February and August, respectively, and in 1917 they sold for 25 and 18 per cent in February and August, respectively, below the price of packer hides, thus indicating that the actual margin was about three times as great in the latter period as in the former, while the percentage of difference was about twice as great in the latter period.

To illustrate this point of difference exactly, an instance may be taken where packer hides sell for 20 cents and country hides for 17½ cents and in which packer hides sell for 30 cents and country hides for 26¼ cents. The absolute difference in one case is 2½ cents and in the other 3¾ cents, but the percentage of difference is the same in both instances, viz, 12 per cent. If the parity was right when the hides sold at 20 and 17½ cents, it was probably about right when they sold at 30 and 26¼ cents. As a matter of fact, no such identical parity has ever been maintained, but for many years prior to the war it was approximately so.

As already stated, the departure from this ordinary parity was the occasion of great complaint. The difference came about by the price of packer hides advancing much more rapidly than the price of country hides. The widening of the difference between the two classes is clearly brought about by comparing the prices at Chicago of heavy cowhides (packer) and No. 1 country heavy cowhides in a particular week in each year from 1913 to 1917, inclusive. Such a comparison is shown in the following statement from Hide and Leather:

Prices of hides at Chicago for five years.

Chicago packer and country hides.	Heavy native cows.	No. 1 country heavy cows.
Week ending Oct. 3, 1917.....cents..	32	23
Same week, 1916.....do....	26	21
Per cent increase, 1917 over 1916.....	23.08	9.52
Same week, 1915.....cents..	24	20
Per cent increase, 1917 over 1915.....	33.33	15.00
Same week, 1914.....cents..	19	16½
Per cent increase, 1917 over 1914.....	68.42	41.54
Same week, 1913.....cents..	18½	16
Per cent increase, 1917 over 1913.....	72.97	43.75

From the foregoing statement it will be seen that from October, 1913, to October, 1917, heavy native packer cowhides increased in price from 18½ cents per pound to 32 cents per pound, or nearly 73 per cent, while No. 1 heavy country cowhides increased from 16 cents to 23 cents, or not quite 44 per cent. The margin of packer

above country hides was 2½ cents per pound in 1913, or 13½ per cent, while in 1917 the margin was 9 cents per pound, or 28 per cent. Thus the margin based on the percentage of value more than doubled. If the margin in 1913 was a fair one (and there is no reason to believe it was not), then the price of country hides in 1917 should have been approximately 27½ cents instead of 23 cents, unless there was some change in the relation of supply and demand for these classes of hides.

Section 4. Gross profits of dealers in country hides.

Representatives of the Commission examined the records of a large number of country hide dealers, and from these records were taken the prices these dealers paid for hides and the price at which they sold them. These were all of the larger dealers, mainly those who dispose of their hides direct to tanners. It was not possible to secure data from the smaller dealers—that is, those who purchase from the country merchant and farmer and who sell to larger dealers—for the reason that their records were not in such form as to permit the compilation of reliable statistics. The prices shown and discussed here are, therefore, the final prices and not the prices paid to the primary or first owner of the hides nor the prices that the small hide collector received for his product.

In most instances it was not possible to obtain prices by grades. The selling price was frequently shown for different grades, but, as already stated, these dealers usually bought their hides at average prices for lots, and it was not possible to show the buying price for specified grades. To compare buying and selling prices grades had to be ignored, and the average price received for all hides have been compared with average price paid for all hides except in a very few instances where specific grades are indicated.

The prices thus obtained have been tabulated and results are shown in Table 3 below. The best description possible is indicated, but it is usually not definite. Cowhides are distinguished from calf and kid as a class, but whether the hides in any class or group are No. 1 or lower grade is not shown. For the purpose of showing the margins of profit realized by dealers, the comparison of such figures are useful, but they do not indicate the actual price paid and received for specific grades of hides.

[1] Loss.

Perhaps the most noticeable fact disclosed by the foregoing table is the wide range of prices paid and received by dealers. This is no doubt partly due to the wide difference in the quality of hides handled by various dealers, for it must be kept in mind that the prices are averages for all grades. That this disparity of price is not due chiefly to variations in the average quality, however, is evidenced by the fact that pronounced differences in price are shown in the few instances where specific grades are indicated. Upon the whole, the figures suggest that competition and supply and demand must have worked imperfectly in determining relative prices.

There was a constant increase in price from 1914 to 1917 and a marked decline in 1918. Hides classified as "extremes,"[1] which classification is perhaps the most definite shown in the table, probably best illustrates the fluctuations in prices. The prices paid for this class of hides ranged in 1914 from 12¾ cents to 17¾ cents; in 1915 the prices increased and the range was from 15¼ cents to 20 cents; by 1917 the prices had increased to a range from 20 cents to 27 cents; while in 1918, it dropped to a range of from 14½ cents to less than 20 cents. Selling prices to tanners fluctuated in much the same manner.

The margin of profit realized by dealers in country hides has on some classes been very liberal while on others it has been narrow. On calf and kip skins the margin has been wider generally than on other classes. During the last two years a number of dealers realized from 15 to as high as 40 per cent above the cost on calfskins and about as good margins on kip. These margins are gross and all the expenses of conducting business must be deducted before a net margin is shown. These expenses could not be obtained in a satisfactory manner. This was due in most cases to the fact that these dealers handled other skins, such as sheepskins, and some of them other commodities, which could not be separated from the class shown in the table.

[1] Extremes are hides ranging in weight from 25 to 45 pounds.

CHAPTER III.

COSTS AND PROFITS OF TANNERS.

Section 1. Introduction.

As already noted (see p. 8), the cost-accounting work which the Commission was called upon to do in connection with the conduct of the war delayed the execution of the plan outlined for this investigation. The information in hand at the time of the signing of the armistice was sufficient to enable a conclusion to be reached as to the relative cost of producing leather in 1914, 1916, and 1917. There did not, therefore, seem to be any justification for further expenditure of money and further delay in completing the inquiry.

The usual methods of the Commission were adhered to in computing costs. All expenses incurred in connection with hides, such as freights and handling, and all expenditures made for converting them into leather were allowed in arriving at costs. Depreciation of equipment was usually allowed as charged by the tanneries. An important item of depreciation occurs in connection with vats, and since these vats are so frequently renewed this is considered by the tanners an operating expense. Under the circumstances this seemed reasonable, and it was so allowed. Interest and Federal taxes have not been allowed as elements of cost, but State and local taxes have been allowed. Selling expenses are not included in cost.

Investment and earnings are shown for 53 companies. The net investment was used and arrived at by deducting current liabilities and reserves set up for depreciation from the total assets shown in the balance sheets. Investments in stocks and bonds and other outside investments were deducted. Bills payable are considered as current liabilities. This computation was made from the balance sheets at the beginning and the end of each year, and the average of these results was taken as the net investment for the year.

The earnings were ascertained by deducting from the total sales the cost and selling expenses. Wherever it was possible interest and Federal taxes were added to earnings, and all income from outside investments were deducted.

The net investment of the tanning business as here described is compared with the net earnings from that business.

Section 2. Cost of producing sole leather.

The cost of producing sole leather is shown for five tanneries. The figures cover the three years 1914, 1916, and 1917. The five establishments had an average annual production of about 184,000,000 pounds. The largest production of any one was, in round figures, 124,300,000 pounds, in 1916, and the smallest was slightly below 6,000,000 pounds, in 1914. The production in the various tanneries ranged in the year of largest output (1916) from less than 6,500,000 to more than 124,000,000 pounds. The quantity produced by each tannery for each of the three years is shown in the following statement:

Sole-leather production in pounds.

	1914	1916	1917
Company No. 3	11,137,968	11,724,780	9,459,343
Company No. 4	108,496,028	124,345,498	90,790,645
Company No. 5-2	5,549,354	6,454,754	6,709,265
Company No. 6	43,055,537	60,673,945	50,930,391
Company No. 7	8,591,016	8,139,390	8,011,224

There is thus shown cost for a group of establishments having a wide range of capacity. While these five tanneries may not fairly represent costs for the industry as a whole, they show costs in efficient tanneries and they show the extent of the increase in costs and where the increases occur. It is fair to assume that the increases shown for these tanneries fairly represent the increases in the industry. The costs in these five tanneries are shown in Table 4 below:

TABLE 4.—*Comparative cost of producing sole leather, years 1914, 1916, 1917.*

[Average cost per pound.]

[1] Figures not available.

[2] Includes labor and factory expense.

[3] Details not available.

During the four years 1914–1917 the total cost of producing sole leather in the four tanneries for which the cost of hides are shown increased per pound of leather produced 8.9 cents, 10.5 cents, 12.8 cents and 21.3 cents, respectively. In three of the four tanneries about 85 per cent of the increase was due to increased cost of hides. Material and labor and factory expense increased at a greater rate than the cost of hides, but altogether the tanning costs did not greatly affect the total cost of leather. In 1914 the cost represented by hides ranged from around 75 per cent of the total cost to as low as 60 per cent. By 1917 the percentage of the total represented by the cost of hides was slightly higher. The increase in tanning costs during the four years ranged from 1.6 cents per pound in Company No. 5–2 to 3.2 cents in Company No. 7. This emphasizes the importance of hides as a factor in the final cost of leather. In arriving at the cost of hides credit was given for offal sales. The value of offal in sole leather is very small.

It is interesting to compare the increase in costs with the increase of prices received for leather. In Company No. 4 the cost in 1917 was 37.7 per cent above the cost in 1914, and the prices received for leather were 60.3 per cent greater in 1917 than in 1914. In Company No. 6 the increase in cost of production was 44.3 per cent, while the increase in the price received was 65.9 per cent. In Company No. 7, which had an extremely low cost in 1914, increase in cost was exactly 100 per cent, while the increase in the price received was 76.2 per cent. It will be noted from the table that the great increase of cost for Company No. 7 was due very largely to the extremely low cost of the hides it used in 1914.

Section 3. Cost of producing upper leather.

The cost of producing upper leather is shown for only two companies, and it was possible to show in detail all the separate elements of cost for but one of them. They are both large and efficient companies, and probably represent a cost for operating expenses below the average. The figures therefore can not be considered as representative of cost in the industry. One company produced mainly calf upper only, while the other produced side, kip, and calf. Company No. 1 had excellent records and the details of its operations are shown in Table 5 below.

TABLE 5.—*Comparative cost of producing upper leather, years 1914, 1916, 1917.*

(Company No. 1—Average cost per square foot.)

	1914	1916	1917
Hide cost	$0.187	$0.236	$0.328
Less offal	.005	.007	.019
Net hide cost	.182	.229	.309
Tanning costs:			
Materials	.015	.032	.040
Labor	.018	.022	.030
Factory expense	.017	.018	.028
General and administrative expense	.002	.002	.006
Total	.052	.074	.104
Total hide and tanning cost	.234	.303	.413
Less credits (splits)	.001	.003	.005
Total net cost	.233	.300	.408
Production.....feet..	12,371,938	10,439,755	9,547,350

From this table it is seen that the total cost of producing finished upper leather increased from 23.3 cents in 1914 to 40.8 cents in 1917, or an increase of 75 per cent. The net cost of hides, that is the cost after deducting the value of offal, increased from 18.2 cents per square foot of leather produced to 30.9 cents, or an increase of 70 per cent. The tanning cost increased from 5.2 cents in 1914 to 10.4 cents in 1917, or exactly 100 per cent. Of the factors constituting tanning costs, tanning materials increased 167 per cent, while labor increased 67 per cent; factory expenses—that is general supplies and repairs, depreciation, etc.—increased 65 per cent; and administration expenses, which is a very small item per square foot of leather produced, increased 200 per cent.

The value of offal, such as glue trimmings and hair, has been deducted from the total cost of hides. The values allowed for splits are the credits shown on the books of the company. Labor and other expenses incidental to the production of splits is all charged to the finished leather. The credit for splits is very small per foot of leather produced, for the reason that practically all of this leather was made from calfskins and very few splits are produced in tanning this class of leather.

Company No. 2 produced side, kip, and calf upper, but because of the manner of the accounts no details could be shown without an inordinate expenditure of time. There is shown here therefore only the total cost of finished leather. The costs are shown in Table 6, below.

TABLE 6.—*Comparative cost of producing upper leather, years 1914, 1916, 1917.*

(Company No. 2—Average cost per square foot.)

	1914	1916	1917
Side upper	$0.234	$0.280	$0.326
Kip upper	.201	.246	.353
Calf upper	.216	.285	.387
Production:			
Side upper....feet.	12,173,151	24,853,471	21,941,887
Kip upper....do....	11,348,488	12,482,443	9,433,749
Calf upper....do....	16,302,135	11,483,225	6,503,382
Total upper-leather production....do....	39,823,774	48,819,139	37,879,018

This company had a comparatively low cost due in a very large degree to the fact that it has ample capital to take every advantage of the hide market, and it often secures hides at a comparatively low price. Its cost of producing side upper leather increased 40 per cent between 1914 and 1917. The cost of producing kip upper during the same period increased about 75 per cent, while the cost of producing calf increased nearly 80 per cent.

Company No. 2, which produced a large quantity of side upper, greatly increased its output of that class of leather in 1916, and the increase was fairly maintained in 1917. The falling off in the production of calf was due to a change in demand. On account of war conditions there was an extra demand for side upper leather and a corresponding falling off in the demand for the lighter leathers, such as calf and kip. The decreased production may account for the fact that in company No. 2 the increase in the cost of side upper leather was far below the increase in the cost of producing the lighter leathers.

Section 4. Increased costs in 1918.

Tanning costs for 1917 were appreciably higher in the latter part of the year than in the earlier months. This increase continued into the early part of 1918, as is shown by the costs found for the War Industries Board, when they were invariably higher and in some instances much higher than the average for the year 1917. Thus, while the cost for company No. 3 was 8.4 cents per pound for producing sole leather in the year 1917, in the first four months of 1918 it increased to 11.6 cents, or 3.2 cents per pound. The costs of company No. 4 increased from 8.8 cents in 1917 to 9.1 cents for the first four months in 1918, or less than one-third of a cent a pound; the cost of company No. 5–2 increased from 9.9 cents in 1917 to 13.2 cents for the month of April, 1918, or 3.3 cents; for company No. 6 the cost increased from 8.6 cents in 1917 to 10.4 cents for the first four months of 1918, or 1.8 cents increase; and for company No. 7 the increase was from 8.8 cents in 1917 to 9.7 cents for the first four months of 1918, or an increase of 0.9 cent per pound.

Hides were higher in their cost, and consequently the total cost of producing sole leather was considerably higher in 1918 than it had ever been before.

The tanning cost of producing calf upper leather in tannery No. 1 by April, 1918, had increased over the cost for the year 1917 by approximately 3.5 cents per square foot, but the cost of hides had decreased somewhat and the increase in the total cost of leather was very slight. In the case of company No. 2, in which no separate cost is shown for hides in 1917, the total cost of producing leather had increased 3.2 cents per foot in April and May, 1918, above the average cost for the year 1917.

The figures obtained for three companies that produced calf upper leather in 1918 indicate that the maximum cost was reached in the first two or three months of the year. In April and May the costs for two companies were lower than in January, February, and March, and in another company the increase was slight, and in another company the tanning costs were less in May than in April. The increase in the costs in the early months of 1918 were found in practically every item, including hides, labor, and tanning materials. The general administrative and miscellaneous expenses constituted a comparatively small item and in some cases there was a slight increase, but it did not materially affect the total cost.

Section 5. Investment and earnings in the tanning business.

All of the tanners of the United States were requested to furnish balance sheets for the years 1914, 1915, and 1916. In connection with the work for the War Industries Board, balance sheets for 1917 were secured from a large number of concerns whose costs were ascertained. Altogether there were found to be 53 companies whose balance sheets and profit and loss statements were in such form as to enable a tabulation to be made showing the net investment and the net earnings from operations.

The statements submitted by the companies for the years 1914, 1915, and 1916 were sometimes not in such detail as were those which were secured by the accountants of the Commission covering the year 1917. In connection with profit and loss it was not possible to determine in many cases from the statements supplied by the companies whether the net earnings was a figure representing the earnings of the business before or after the payment of interest and Federal taxes. In most cases it would seem that Federal taxes and interest had been deducted in the income statements. For the year 1917 these items were usually shown separately, and where they had been deducted they were put back into earnings. The item of Federal taxes was much smaller in the years prior to 1917 than in 1917, and the exclusion of that item from net income does not so seriously affect the results

of their statements as it would have done to have excluded them from 1917. The results of these 53 companies are shown in Table 7 below:

TABLE 7.—*Rates of earnings on investment in the tanning industry, 1914–1917.*

[1] Loss.

It is a safe assumption that the 53 companies represented in the foregoing table are a fair index to the general conditions in the tanning business. The table includes a number of very small companies, a number of large ones, and a considerable number of what may be considered average concerns.

The table shows a remarkable increase in the earnings in the tanning business since 1914. In 1914, the year of poorest results shown in the table, the industry as a whole was prosperous. Only 2 companies of the 53 represented in the table incurred a loss from operations, and only 11 of the 53 showed earnings of less than 6 per cent, while a number showed earnings above 10 per cent, and several 20 per cent and more. These rates of earnings were generally increased in 1915 and by 1916 they had reached large proportions, and these high rates of earnings were well maintained in 1917. In 1916 and 1917 it was rather unusual for a company to make less than 20 per cent on its investment and in 1916, particularly, many of them made 40 per cent and more.

The figures for earnings are in harmony with the comparisons already made between the cost of producing sole leather and the prices at which it was sold. It will be recalled that the increase in price was considerably more than the increase in cost. The increases in this table point conclusively to the fact that these conditions existed in respect to most, if not all, kinds of leather. In 1916, there were only 8 companies out of 53 that had a net return on investment of less than 10 per cent, and in 1917 there was only 1 company that had a net return of less than 11 per cent, and this one earned over 7 per cent. As already stated, most of them in both of these years earned from more than 20 to as high as 40 and 50 and 60 per cent, and some even higher. As will appear later (see Table 39, p. 100), the profits realized by tanners were generally somewhat higher than the profits realized by shoe manufacturers.

The data on which Table 7 is based have been summarized and the results are shown in the statement below. The companies were divided into four groups. Group I includes companies having an investment of less than $100,000; Group II includes those having an investment of $100,000, but less than $250,000; Group III contains those having an investment of $250,000 and under $1,000,000; and Group IV contains those having an investment of $1,000,000, and over.

Two of the companies in Table 7 are omitted from the summary, because they did not have figures for each of the years from 1914 to 1917, and one company is omitted because its investment was very large and because its profits were abnormally low. The investment of this large company is so great that it dominates Group IV, and, in fact, its investment and its low rate of earnings so greatly affect the results of the total number of companies that its inclusion would show an average that does not represent the industry in general.

Rates of earnings on investments of 50 tanning companies grouped according to amount of investments, 1914–1917.

Groups.	1914	1915	1916	1917
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*
I. Under $100,000	9.7	15.7	24.0	32.6
II. $100,000 to $250,000	13.6	23.5	26.6	34.4
III. $250,000 to $1,000,000	12.4	16.0	30.4	29.3
IV. Over $1,000,000	12.8	16.4	34.6	25.4
Total	12.9	16.5	33.8	25.7

The foregoing statement shows that the group of companies having the lowest investments also had the lowest rate of earnings for each year except 1917. In that year the group of small companies had a higher rate of earnings than the two groups containing the companies of largest investments. It will be noted from the statement that the

earnings of each group were very much greater in 1916 and 1917 than they were in the two preceding years except in Group II where the earnings in 1916 were only about 3 per cent more than they were in 1915.

The average rate of earnings for the 50 companies were practically twice as great in 1916 and 1917 as they were in 1914 and 1915. The year of highest earnings was 1916. It should be noted in this connection that the inclusion of the one very large company mentioned above would reduce the rate of earnings in Group IV from 5 to more than 10 per cent; in 1914 it would reduce it 5 per cent; in 1915, 5½ per cent; in 1916, 11½ per cent; and in 1917, 6 per cent. With the inclusion of the large company in the total the average rate of earnings are similarly reduced though not quite to the same degree.

CHAPTER IV.

COSTS AND PROFITS OF SHOE MANUFACTURERS.

Section 1. Introduction.

The inquiry as to cost of production covered 34 companies. These companies operate factories from New England to as far west as St. Louis, Mo., and as far south as Atlanta, Ga. Of these companies 12 made men's shoes only, 6 made women's shoes only, 3 made misses' shoes only, and 1 made children's shoes only. There were 2 of these companies that made men's, women's, misses', and children's shoes, and 1 made men's and women's only. All the factories making infants' shoes made other shoes with one exception.

Costs were secured for standard staple shoes only, as comparative figures for novelties and fancy shoes were not available for the reason that there are such frequent changes in styles in these classes of shoes. In order to make comparisons, it was necessary to take only those shoes in which the grade and style did not change during the period covered. Only a small percentage of the various grades and styles made were covered by the inquiry. To have secured data even for all the standard grades and styles made in some factories would have involved a great length of time without adding value to the results. The shoes taken were representative of the various grades and styles of staple shoes from the very cheap to the best class of dress shoes.

The accounts of the shoe manufacturers were generally in excellent form so far as individual companies were concerned. There was, however, a lack of uniformity in accounting that made necessary considerable adjustment in order to put the results on a strictly comparable basis. The cost data were secured in great detail, and these data were classified into groups and results are shown separately for each general class of shoes. These classes are men's, women's, misses', children's, and infants' shoes.

Schedules were sent to shoe manufacturers requiring balance sheets and profit and loss statements. More than 1,000 of these schedules were returned, but owing to defects only 237 were sufficiently complete and definite as to permit their use in the computation of rates of earnings. These 237 companies are from all sections of the United States, and their results are no doubt fairly representative of the industry as a whole. Some of the data for investment and earnings were secured from books of the companies by the accountants of the Commission.

The period covered for cost of production was the five years ending with 1918, though data were not always obtained for each style of shoe for each year in the period. In tabulating the results the plan

adopted was to show data for each shoe that was produced in three years of the period covered. In some years a style was not made, but was again taken up in the following year. All the cost data were secured during the year 1918, and the accounts of some factories visited in the early part of the year were not sufficiently complete to enable costs to be computed for that year.

The table showing investment and earnings covers the four-year period ending with 1917. The field work on the investigation having been completed before the end of the year 1918, no balance sheets were secured for that year.

Section 2. Cost of producing shoes.

The cost of production is shown for 33 of the 34 companies covered by the investigation. Data are shown for 12 companies manufacturing men's shoes exclusively, for 6 companies producing women's shoes exclusively, 3 companies producing only misses shoes, and 2 companies producing children's shoes exclusively. All of the shoes for infants were made by companies manufacturing other classes, except in one case. There were 10 companies that made 2 or more classes of shoes and 2 of these companies made all classes except infants. These 33 companies are operating in all the principal shoe manufacturing centers from New England to St. Louis, Mo., and from Milwaukee, Wis., to Atlanta, Ga. They include factories ranging from moderately small to very large production.

The cost of production is shown in a group of four tables, each table showing a separate subdivision of cost. The headings under which these tables are shown are: "Leather," "Materials other than leather," "Labor," and "Overhead expense."

Leather includes all leather of every character used in the production of the shoe. The principal items are upper and sole leather. Materials other than leather include linings, facings and stays of cloth, fiber and leather board parts, nails, thread and screws and all other findings as well as cartons and packing cases.

Under the head of "Labor" is included the labor that was employed directly in the production of the shoe except in a few cases. In a very few instances no distinction was made by the companies as between direct and indirect labor. The inclusion of some indirect labor in a few companies does not seriously impair the usefulness of the comparisons made.

Overhead expenses include all items of factory expense other than material and direct labor. There are here included salaries of officers and office help, superintendence, indirect factory labor such as engineers, firemen and watchmen, power, light, heat, repairs, depreciation, royalties, office expense and all other general miscellaneous items. In most instances it was necessary to calculate the amount of overhead expense that was properly chargeable to each grade of

shoe. This was done in every case except for companies 115, 316, 396, 478, 541, 543 and 849. The distribution of overhead expense was based upon net sales. The total overhead for a year was divided by the total net sales for a year to arrive at a percentage of overhead expense that should be applied to each particular shoe. The net selling price of each grade of shoe was multiplied by the rate thus found in order to arrive at the overhead expense applicable to that particular shoe. This may be illustrated by the case of a factory whose total overhead expense amounted to $29,631 and the sales to $626,483. The overhead expense in this case was 4.7 per cent of the total sales. A shoe that sold for $1.90 would therefore have an overhead charge against it of 8.99 cents. This method was used in all cases except in the seven companies noted above. In those companies no adjustment was made and the amount of overhead allocated to each grade or style of shoe by the company has been used in the table. There was no uniformity among the various companies as to the distribution of overhead. Some distributed it on a basis of material and labor, others used direct labor only, some distributed it on a basis of piece work labor, and others used a flat charge for all grades. Some guessed at it, while several used the method that has been adopted by the commission. Some tests were made as between the direct labor basis and the basis adopted here and the results in each case are almost exactly the same.

The cost tables are followed by a table showing a comparison of the details of cost with the total cost for a few shoes of each class selected at random. There is another group of two tables showing first, the total cost (which is made up by adding together the items in the group of four tables) and the selling price and the margin between the two, and second, the total cost and manufacturers selling price of shoes with the percentage of increase or decrease of each for 1914 and 1917. These tables are shown in the section following. These tables, however, have been grouped under four appropriate class heads as above indicated.

MEN'S SHOES.

The details of the cost of producing men's shoes and the percentage of increase each year over the preceding year and over 1914 are shown in tables 8 to 11 inclusive. Both the details and total cost and percentage of increase could not be shown conveniently in a single table. The totals are shown in both Tables 29 to 33 and 34 to 38 in section 3 following. The companies are arranged in the same order in all the tables and the comparison of the totals with details is thus made comparatively easy. Eighty different grades and styles of men's shoes are covered by these tables.

Cost of leather.—The cost of leather for men's shoes is shown in Table 8 below.

[1] Decrease.

The costs of 47 different grades and styles of men's shoes produced in 1917 was comparable with similar costs in 1914. The cost of leather in 1917 was over 40 per cent greater than in 1914 for 42 of these grades and styles. There were 34 that had an increase of over 50 per cent, and 10 that had an increase of over 100 per cent. There was a general reduction in the cost of leather between 1917 and 1918. The table shows 40 grades and styles of shoes that can be compared for these two years and 25 of these grades show a reduction in the cost of leather.

Other materials.—The cost and percentage of increase from year to year of materials other than leather are shown in Table 9 below.

Of the 47 styles for which comparisons can be made between 1914 and 1917, 34 had an increase, in 1917, of more than 40 per cent over the cost in 1914. There were 24 styles that had an increased cost of over 50 per cent and only 5 with an increased cost of more than 100 per cent. In one factory, No. 233, 5 different grades and styles of shoes were made and the cost of materials other than leather in each of these shoes was 177 per cent greater in 1917 than it was in 1914, while the increase in the cost of leather for these shoes averaged only about 40 per cent. This was no doubt due to the extent to which substitutes for leather were used in the production of these styles. All these shoes except 1 style were of comparatively low grade. There were only 5 grades of shoes that had a less cost for materials other than leather in 1918 than in 1917, and there were a number of substantial increases. Of 40 shoes for which figures were shown, 18 had an increase of more than 20 per cent in 1918 over 1917.

Labor cost.—The cost of direct labor in men's shoes is shown in Table 10 below:

[1] Decrease.

There was considerable increase in labor cost in 1917 over 1914, but this factor did not increase at nearly as great a rate as either leather or other materials. Of the 47 comparable grades of shoes here under consideration, only 2 had as much as 40 per cent increase for labor in 1917 over 1914. There were 44 grades that had an increase of less than 20 per cent. There were 23 that had an increase of less than 10 per cent, and 1 had a decrease of a little over 3 per cent.

Overhead expense.—The charges for overhead expense, which includes all expense not included in the three preceding tables, are shown in Table 11.

TABLE 11.—*Comparison of overhead expenses in men's shoes, per pair, 1914–1918.*

[1] Decrease.

A notable fact disclosed by the above table is the number of instances in each year subsequent to 1914 where overhead expense was less than in that year. Exactly 40 per cent of the comparable grades showed a decrease between 1914 and 1915, though it was usually small. Out of the 47 comparable grades the overhead expenses of 14 increased over 40 per cent between 1914 and 1917. Another increased over 100 per cent; there were 9 that had an increase of less than 10 per cent and 14 had decreases. Thus, 50 per cent of the 47 shoes either had a decrease in overhead expense between 1914 and 1917 or an increase of less than 10 per cent. Between 1917 and 1918, 40 per cent of the comparable grades of shoes had a decrease in overhead expense.

The absolute amount of overhead expense does not bear the same relation to factory output as do other elements of cost. The cost of materials chargeable against a pair of shoes is exactly the same whether the factory output is large or small. This is substantially true as to labor. Thus, actual outlay in labor and materials is governed by the number of pairs made. This, however, is not true of overhead expense. The charges for this element of cost must be distributed over the output. Many items of overhead expense, such as salaries of officers, superintendents, clerks, bookkeepers, depreciation, and many other similar items, are practically fixed. They are the same whether the output is large or small. These expenses must be distributed among the number of pairs of shoes made. If the output is small, the charge per pair is high, and vice versa. During the war salaries increased, but in many cases the effect of this increase upon the charge per pair of shoes was more than offset by increased output. This accounts for the comparatively small increase per pair from year to year during the period and the many instances of decreases.

WOMEN'S SHOES.

The detailed tables for women's shoes cover 55 different grades and styles. Of this number the costs of 52 in 1914 are comparable with costs in 1917.

Cost of leather.—The cost of leather is shown in Table 12 below:

TABLE 12.—*Comparison of cost of leather in women's shoes, per pair, 1914–1918.*

[1] Decrease.

All of the 52 grades and styles made in 1917 that are comparable with 1914, except one, had an increased leather cost of more than 40 per cent, and this one exception had an increased cost of nearly 20 per cent. There was an increase of nearly 75 per cent for 40 grades and styles of women's shoes. In other words, almost 80 per cent of the 52 grades and styles had an increased leather cost of more than 75 per cent. There was an increase of over 100 per cent in 23 grades and 10 had an increase of over 125 per cent.

There was a decrease of leather cost between 1917 and 1918 for 25 of the grades and styles that are comparable as between those two years, and 14 of these decreases were 10 per cent or more. There was but one increase in 1918 over 1917 that amounted to as much as 20 per cent, and 9 of them amounted to less than 10 per cent.

Materials other than leather.—The cost of materials other than leather for women's shoes are shown in table 13.

[1] Decrease.

A comparison of the foregoing table with the table for leather cost shows that these other materials did not increase between 1914 and 1917 as much as leather. Of the 52 comparable styles, only 12 increased as much as 75 per cent as against 40 styles that had that much increase in leather cost. There were 8 styles that had an increase of less than 40 per cent, while there was only 1 that had as small an increase in cost of leather. There was 1 style that had a decrease. There were practically no decreases after 1915. There were 11 decreases in that year as compared with 1914, and in each instance the cost of materials other than leather in 1918 exceeded that of 1917, and in 15 of the 52 styles the increase exceeded 25 per cent.

Labor cost.—The cost of labor for women's shoes and the changes in this cost are shown in Table 14.

[1] Decrease.

As in the case of men's shoes, the increase of labor cost in 1917 over 1914 was at a much lower rate than the increase in leather and other materials. The increase exceeded 40 per cent in only five of the 52 grades of shoes here considered. The increase was less than 20 per cent for 14 grades of shoes and there was a decrease in the labor cost of two styles. In 1918 the cost of labor over 1917 considerably increased, this increase ranging generally above 10 per cent, and in some instances over 25 per cent.

Overhead expense.—A comparison of overhead expense is shown in Table 15 below.

TABLE 15.—*Comparison of overhead expense in women's shoes, per pair, 1914–1918.*

[1] Decrease.

The above table shows these expenses greatly increased between 1914 and 1917. The increase was over 40 per cent for more than half of the 52 comparable grades. There were 17 grades and styles that had an increase of more than 50 per cent. The increase for 21 of the 52 grades was less than 20 per cent. There are a number of instances in which the overhead expense was less in 1915 and 1916 than it was in 1914. For 25 per cent of the grades here compared, there was a less charge for overhead in 1918 than in 1917.

Misses' shoes.—The details of costs for misses' shoes are shown in tables 16 to 19, inclusive. These tables cover shoes produced in 9 factories and include 22 different grades and styles. Of this total number of grades, 13 are comparable as between 1914 and 1917, and 11 grades and styles are comparable as between 1917 and 1918.

[1] Decrease.

Of the 13 grades and styles shown in the above tables, where comparisons are possible, they all had a cost of leather in 1917 of more than 60 per cent in excess of the leather cost in 1914, and 8 of them had an excess of over 75 per cent. Between 1917 and 1918 there was a general reduction in leather cost. Of the 11 comparable grades and styles, as between 1917 and 1918, 7 had a reduced leather cost. This was probably partly due to the increased use of substitutes.

The cost of materials other than leather in 1917 exceeded the cost in 1914 as much as 60 per cent in only two instances, the increase generally falling between 45 per cent and 60 per cent. In only 2 instances out of 13 did it fall below 35 per cent, the smallest increase being slightly below 30 per cent. The cost of other materials in 1918 was substantially greater than in 1917 in all cases. For two grades of shoes the increase was more than 75 per cent. It will be noted that the leather in nearly all these shoes cost less in 1918 than it did in 1917. This fact, taken in connection with the uniform and substantial increase in the cost of other materials, suggests that substitutes for leather were used in misses shoes in 1918 to a very pronounced extent or that these other materials advanced in cost while the cost of leather declined. Perhaps both these factors contributed to these marked changes in cost between 1917 and 1918.

As with all classes of shoes, labor cost in misses shoes advanced at a much lower rate than did leather or other materials. In about half of the shoes here compared the cost of labor in 1917 was less than 10 per cent above the cost in 1914. For only 3 grades of shoes did it increase as much as 25 per cent.

CHILDREN'S AND INFANTS' SHOES.

The data here shown cover 30 grades and styles of children's shoes made in 9 different factories and 14 different grades and styles of infants' shoes made in 4 factories.

Children's shoes.—Details of cost for children's shoes are shown in Tables 20 to 23, inclusive:

The increase in the cost of leather and other materials in children's shoes from 1914 to 1917 was at about the same rate as the increase in misses' shoes. There is also the same significant difference seen in the costs of 1918 as compared with 1917. Of 12 grades and styles comparable in these two later years, one showed an increase in the cost of leather; one had the same cost, and 10 had a decrease. For materials other than leather, one grade had the same cost in 1918 as in 1917 and 11 had substantial increases, 5 of the increases exceeding 25 per cent.

The cost of labor in 1917 exceeded that of 1914 as much as 25 per cent in but three grades and styles of shoes out of 16, and in two grades there was a reduction. In exactly half of the grades for which comparisons could be made, the increase in labor cost was less than 12 per cent. In 1918 the cost of labor exceeded that of 1917 for all children's shoes except one grade and that was the same. The increase ranged from 6 per cent to 15 per cent, the prevailing increase being close to 12 per cent.

The increase of overhead expense in 1917 over 1914 was less than 22 per cent for 7 shoes out of 16 and for the other 9 it was over 50 per cent. It was above 60 per cent for 6 grades and styles.

Infants' shoes.—The details of cost for the 14 grades and styles of infants' shoes are shown in tables 24 to 27, inclusive.

[1] Decrease.

Of the 14 different shoes included in the foregoing table the costs in 1914 can be compared with costs in 1917 for 9 styles. The cost of only 5 grades and styles made in 1917 can be compared with 1918.

All of the shoes for which comparisons can be made as between 1914 and 1917, had an increased leather cost of more than 63 per cent. Only 5 shoes made in 1917 can be compared with 1918, and in 4 of these the cost of leather decreased. The cost of materials other than leather in 1917 over 1914 showed an increase considerably below the increase in the cost of leather. This differs from the conditions shown for children's shoes in which the advance in the cost of leather and that of other materials was about the same. The cost of materials other than leather in 1918 in infant's shoes greatly increased over that of 1917.

For the 5 comparable grades and styles as between 1917 and 1918 there was a considerable increase in labor cost as between these two years. The overhead expense in 1917 greatly exceeded that of 1914 in nearly every case. In only one instance was it less than 39 per cent.

COMPARISON OF DETAILS OF COST WITH TOTAL COST, 1914–1917.—The percentage that some of the elements of cost is of the total cost of producing shoes changed materially between 1914 and 1917. This is especially marked in the cost of leather. The changes are due to the fact that the items in the 4 headings of cost shown in the tables of details of cost did not all change at the same rate. The increase in the cost of leather and other materials was much greater than in labor and overhead expense. To illustrate these changes during the four years ending with 1917, there has been made a random selection of 27 descriptions of shoes from among the 5 classes for which details are shown in Tables 8 to 27 inclusive. The total cost was found by adding the items of the details. The results of this computation are shown in Table 28 below.

TABLE 28.—*Comparison of details of cost with total cost per pair, 1914 and 1917.*

It will be noted that leather constituted from about 50 to 70 per cent of the total cost of all classes of shoes in 1914 except infant's, where it usually constituted only about 40 per cent. By 1917 this percentage had increased to about 60 to 75 per cent for all clasess except infant's, where it had increased to about 50 per cent. In other words, the ratio of the cost of leather in shoes compared with the total cost increased about 20 to 25 per cent during the 4 years. The percentage that materials other than leather was of the total cost did not vary much in the 2 years here considered. The cost of other materials was less than 10 per cent of the total cost in 11 styles of shoes in both 1914 and 1917; it was 10 per cent and less than 12 per cent in 11 styles in 1914; and 13 styles in 1917. It was 12 per cent and less than 15 per cent in 2 styles in both 1914 and 1917, and it was 15 per cent and over in 1 style for both years.

Labor generally constituted a greater percentage of the total cost in 1914 than it did in 1917. There is no shoe shown in the table where comparisons can be made in which the percentage was not less in 1917, and in many instances it was very much less than in 1914. In 1914 there were 9 of the 27 shoes shown in the table in which the labor cost was over 25 per cent of the total cost, while in 1917 there were only 2. In 16 of the 27 shoes here being considered, the labor cost constituted between 15 and 25 per cent of the total cost in 1914 and 13 fell within this group in 1917, but of these 13 shoes there was only 1 where the percentage was as much as 20 per cent in 1917, while in 1914 there were 8 that had a percentage between 20 and 25 per cent.

The percentage that overhead expense was of the total cost was less for all classes of shoes in 1917 than it was in 1914 except children's. For the latter class the reverse was true.

Section 3. Comparison of total costs, selling prices, margins of manufacturers, and increases in costs and selling prices, 1914–1918.

The total cost of producing shoes, the net prices at which the manufacturer sells them, and the percentage that the difference between the costs and selling prices is of the cost are shown in Tables 29 to 33, inclusive. There is a separate table for each of the 5 classes of shoes. A comparison of the increase of costs and selling prices from year to year, and of each year with 1914, is made in Tables 34 to 38, inclusive. The total cost of production shown in these tables was found by adding together the figures shown in the tables showing the details of cost. The prices at which manufacturers sold shoes were taken from their books and records. The selling price is the net price charged by the manufacturer for all companies except 7. This price was arrived at by taking the trade discounts from the invoice price, except for 7 companies, namely, Nos. 115, 316, 396,

478, 541, 543, and 849. To ascertain the trade discounts in these factories would have involved a greater expenditure of time than the results would warrant. In fact, in some cases manufacturers claimed that no trade discounts were allowed. It should be particularly noted that the prices shown are not the net prices realized by the manufacturer, but they are the prices he actually charged the buyer and out of these prices he must pay selling expenses. These selling expenses are usually a very small percentage of the cost of the shoes. There are very few instances in which they amount to as much as 5 per cent, and usually they are much below this. It was impossible, however, to distribute the selling expense incurred by most of the factories over the different styles and grades of shoes included in the tables with any reasonable expenditure of time.

Margins between costs and selling prices.—The margin between costs and selling prices in terms of actual money and percentages, are shown in the tables below. These tables include 190 different grades and styles of standard shoes. It should be pointed out that conclusions as to the return on investment can not be based upon the margins shown for these shoes. It should be kept in mind that only a few of the grades and styles of shoes made in any factory are shown in these tables. Furthermore, from the margin there must be deducted the expenses of selling. A factory may constantly sell a particular shoe at a loss and yet make sufficient profit upon other shoes to give it a satisfactory return on investment. The percentage of profit made by shoe manufacturers on their investment is shown later in Table 39. (See p. 100.)

[1] Loss.

An inspection of the above table shows that of 50 men's shoes, where comparisons can be made between 1914 and 1917, 34 had a gross margin of 7 per cent or more in 1914, and 38 were in this class in 1917. Only 10 had a margin of 20 per cent or more in 1914, while 17 had this high margin in 1917. In 1914 only 2 had a margin exceeding 30 per cent, while 8 exceeded this percentage in 1917.

Of 53 women's shoes that are comparable in the 2 years, 39 had a gross margin of 7 per cent or more in 1914, while 43 had 7 per cent or more in 1917. This grouping, however, does not thoroughly reveal the difference in margins in the two years. In a classification with 15 per cent as the minimum gross margin, it is found that 15 fell in this class in 1914, while in 1917 there were 20 that had a margin of 15 per cent or more. Only 2 shoes had a margin of 20 per cent above cost in 1914, while in 1917 there were 6. In 1914 there were 13 that had either losses or gross margins less than 7 per cent, while in 1917 there were only 9.

The gross margins of profit on misses', children's, and infants' shoes were generally considerably greater in 1917 than in 1914. It is also true that on those shoes in these classes which were sold at a loss, the losses were generally greater in 1917 than in 1914.

In the industry as a whole there was no great difference between the gross margins of profit in 1917 and 1918 for the comparatively few comparisons shown in the table.

Comparison of increases in costs and selling prices, 1914–1918.— The percentage of increase or decrease in costs and selling prices for each year over the preceding year and over 1914 for each class of shoes is shown in Tables 34 to 38, inclusive. The figures as to costs and selling prices in these tables are the same as those shown in Tables 29 to 33, inclusive.

[1] Decrease.

The foregoing tables show that for 137 shoes in which comparisons could be made the selling price advanced at a greater rate than costs between 1914–1917 in 76 instances, but in about one-fourth of these instances the excess of the advance of selling prices over costs was less than 1 per cent. Usually the advances in selling prices closely parallel the increases in costs, though there were occasional instances of marked departure from this general rule.

In 1918 costs in many instances were less than in 1917, but reductions in selling prices occurred in only about half of the shoes showing reduced costs. In a few instances prices decreased while costs increased. As already noted in the discussion of margins, total profits can not be determined by these comparisons. This is true because the shoes here compared represent only a part of the product of the factories. It will be recalled that only staple shoes are represented in the cost tables, and in most cases only a small proportion of the staple shoes made in each factory. There may be many instances in which a part of the product is sold at cost or less than cost, while the profits made on the other part of the product will be sufficient to show a good return upon investment. It should be further noted in this connection that a part of the product of the factory may be sold at cost or less for a perfectly good reason, such as meeting competition.

Section 4.—Investment and earnings of shoe manufacturers.

Satisfactory data for investment and earnings were obtained from 237 manufacturers. From these statements returns of earnings on investment have been computed. The investment is net. To find the net investment the values ascribed to good will, trade-marks, and patents, the amounts invested in other enterprises or other corporations, the current liabilities and certain reserves were added together, and the sum of these amounts was deducted from the total assets. In a very few cases it was impossible to separate the outside investments as they were not shown in sufficient detail to make the segregation. In every case these outside investments were comparatively small. The current liabilities deducted were all of the accounts and bills payable. The usual deduction for reserves was the reserve for depreciation. In some instances the balance sheet showed an item of loans from stockholders. These loans have been treated as other bills payable, except where they were for long terms, and they are included in the deductions. In a few cases the deduction of such loans left a comparatively small amount for net assets, but the rule here described was adhered to in every instance.

The earnings shown are those derived from manufacturing and selling shoes, but as just noted, there were a few instances in which outside investments could not be determined, and in these cases

the incomes from such investments were allowed to remain in the earnings. The instances in which these separations could not be made, however, were but few. All interest and Federal taxes that had been deducted by the companies before making up their income statement were put back with earnings wherever it was possible to determine the amounts of these items. In many cases, however, in the years prior to 1917 it was not possible to determine whether or not Federal taxes were included in earnings, and the accounts had to be accepted as shown by the statements submitted by the companies. The Federal taxes in these years, however, were comparatively small, and did not seriously affect the rates on investment. Wherever the earnings shown in the table vary from exact earnings, they are always smaller than the inclusion of Federal taxes would have made them. The accounts of some corporations disclosed a practice of crediting the loss and gain account with trade discounts taken on the invoices for materials and supplies. This treatment of these discounts sometimes resulted in showing a loss in manufacturing and selling, but in the final statement of the companies it resulted in a profit. All such discounts were treated as earnings.

Attention is called to the fact that among shoe manufacturers there is nothing like uniformity in fiscal years. It was not practicable to adjust the balance sheets to a uniform date, and the fiscal year of each company was adopted in making up the statement of investment and earnings. The year ending nearest to December 31 was taken in each case. The rates of earnings for the four years ending with 1917 are shown in Table 39.

[1] Loss.

From a glance at the foregoing table it can be seen that the rate of return on investment was much greater in 1916 and in 1917 than it was in 1914 and 1915. In 1914 and in 1915 there were 23 and 22 companies respectively that had losses, while in 1916 and in 1917 there were respectively only 3 and 8 companies with losses.

Not only was there a smaller number of companies that had either losses or low rates of earnings in 1916 and 1917, but that of those having higher earnings the number in the higher group was greater in these two years than in the two previous years. Thus the companies having rates of earnings of 15 per cent or over in 1914 were

102. In 1915 there were 98; while in 1916 there were 183 and in 1917 there were 169. Another group based on rates of earnings of 25 per cent and above still further emphasizes the much greater prosperity of the industry in 1917 than in 1914. In 1914 there were 41 companies which earned 25 per cent or more, while in 1917 there were 92 companies in this class. In the year 1916, however, the industry generally was more prosperous than in any other year of the period covered. In that year there were 104 of the 237 companies shown in the table that had earnings of 25 per cent or more. It would appear from these figures, therefore, that taking the industry as a whole it was much more prosperous in 1916 and 1917 than it was in the two preceding years. This not only is shown by the smaller number of companies that suffered losses during the two latter years of the period but also the much larger number of companies that had earnings above 25 per cent.

A summary of the data upon which Table 39 is based has been made and the results are shown in the tabular statement below. The 237 companies in that table have been placed in five groups according to net investments. Group I contains those companies having an investment of less than $100,000; Group II includes companies having an investment of $100,000 and less than $250,000; Group III contains those having $250,000 but less than $1,000,000; Group IV includes those companies having an investment of $1,000,000 but less than $3,000,000; and Group V includes all companies having an investment of $3,000,000 and over:

Rates of earnings on investments of 237 shoe manufacturers grouped according to amount of investment in 1914 to 1917, inclusive.

Groups.	1914	1915	1916	1917
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*
Under $100,000—85 companies	12.8	14.6	31.5	26.5
$100,000 to $250,000—56 companies	16.7	15.8	25.2	22.5
$250,000 to $1,000,000—74 companies	15.5	15.2	26.6	25.0
$1,000,000 to $3,000,000—14 companies	15.0	15.5	26.3	20.3
Over $3,000,000—8 companies	14.7	14.6	25.4	26.3
Average	15.1	15.0	26.1	24.7

The above statement shows that companies with small capital had approximately as good earnings as those having larger investments. The rates of earnings on investments in the last two years of the period were much higher that in the two previous years.

As in the case of tanning companies, shoe manufacturers had a higher rate of earnings in 1916 than they did for any other year. This was true of every group except those of $3,000,000 and over. In most of the other groups the earnings in 1916 were appreciably higher than in 1917. Notwithstanding the wide difference in the earnings of the first two years of the period and the last two years, the rates in 1914 and 1915 were liberal.

CHAPTER V.

MARGINS AND PROFITS OF SHOE DEALERS.

Section 1. Introductory.

In the course of this investigation representatives of the Commission called upon shoe dealers, both wholesale and retail, in many of the principal cities of the country, from Massachusetts to Texas and as far west as Colorado. The dealers seen included 76 wholesalers and 114 retailers. From the books of these dealers there were secured the prices they paid for representative staple shoes of all grades and the prices at which they were sold. From these dealers were also secured statements in regard to the cost of doing business, and in regard to general conditions in the shoe trade during the past few years.

The retailers seen were fairly representative of the shoe trade as a whole. They included those carrying a general line of good shoes, popular-price stores, syndicate stores, department stores, and a few stores handling a general line of military shoes. The wholesalers were fully representative of that branch of the trade.

Section 2. Margins and profits of wholesale dealers.

From the books of wholesale dealers, representatives of the Commission secured the prices paid by them for a number of staple lines of shoes and the prices for which these shoes were sold for the five years, 1914 to 1918 inclusive. With a few exceptions each style of shoe considered was carried by the merchant throughout the period.

In order to assure exact comparisons, no shoe was taken unless the description and style number had been maintained for the period covered. The comparisons are, therefore, as exact as it is possible to make. While the description and style number of the shoe have not changed, this is not a guaranty that the quality has remained the same. In some instances the dealers stated that the quality has deteriorated. In other words, the standard of the quality in the last year or two was not as high as it was in the earlier years of the period. As will be pointed out later, this is alleged to be due to the use of leather of a poorer quality, the use of substitutes for leather, and to labor conditions that have made it impossible to maintain a high standard of workmanship.

During the period covered there has been great increase in prices, with a corresponding increase in the margin of gross profit. The percentage of profit based on cost in 1918 is generally above that of 1914, though the difference is not very great.

The cost and selling prices and margins of profit on several hundred styles and kinds of men's, women's and children's shoes are shown in Tables 40 to 42 below. The shoes have been classified according to cost in 1914. The first group includes those that cost less than $1, the second group from $1.01 to $1.50, and so on by gradations of 50 cents per pair.

TABLE 40.—*Cost and selling prices of men's shoes and margins of gross profit, wholesale dealers—1914–1918.*

The foregoing tables are so complete in detail as not to require minute discussion. It can be observed at a glance what has been the movement of prices and margins for any shoe. A better view of the wholesale shoe business as a whole is shown in a summary of the foregoing tables in Table 43 below. This summary shows the average cost and selling price for each group of shoes classified according to cost in 1914, and the average cost, profit per pair, and the percentage of profit based on cost.

TABLE 43.—*Average cost and selling prices and margins of gross profit of wholesale shoe dealers, based on details in Tables 40 to 42, 1914, 1917, and 1918.*

Items (1914 cost range).	1914				1917				1918			
	Cost.	Selling price.	Margin.		Cost.	Selling price.	Margin.		Cost.	Selling price.	Margin.

The figures in the foregoing tables taken in connection with the cost of doing business (see p. 153) show that the profits of the wholesalers have been greater under a period of high prices than they were in the period of lower prices. This is indicated by the fact that the cost of doing business as compared with sales has been about the same throughout the period, while the percentage of gross profit has in general increased throughout the period. It should be pointed out, however, in this connection that the amount of capital necessary to carry a given stock of shoes was much greater in 1917 and 1918 than in 1914. Since the cost of doing business as based upon sales has remained practically stationary during the period and the percentage of profit based on cost prices has slightly increased, it must follow that the wholesale shoe business as a whole was actually more profitable in 1917 and 1918 than in previous years.

Section 3. Margins of Profits of Retail Dealers.

Data similar to those obtained from wholesale dealers were secured from the books of a large number of retailers. As in the case of wholesalers, the costs and selling prices were obtained for hundreds of kinds and styles of standard staple shoes and from these figures have been computed the gross margin of profit per pair and the percentage of profit based on cost. This information was obtained from representative retail dealers of all classes. As in the case of wholesalers, there was found great increase in prices during the period covered. The cost and selling prices and gross margins of profit for retailers for the five years, 1914 to 1918, inclusive, are shown below in Tables 44 to 46, for men's, women's and children's shoes, respectively. The shoes have been grouped on the basis of cost in 1914 in the same manner as has been done with respect to the wholesalers.

[1] Not handled this year.

A very great increase in the prices of shoes is clearly indicated in the foregoing tables. The citation of a few examples will be sufficient to emphasize these advances in prices. For instance, a man's work shoe that cost $1.75 in 1914 and sold for $2.50, cost the retailer $2.85 in 1918 and sold at $4. In 1914 the retailer made a profit of 75 cents on this shoe, while in 1918 he made a profit of $1.15, but his percentage of profit was less in 1918 than in 1914. A dress shoe that cost $1.90 in 1914 and retailed at $2.50, cost $4.75 in 1918 and retailed for $7. In the former year the retailer made a profit of 60 cents per pair and in the latter, $2.25; his percentage of profit in 1914 was less than 32, and in 1918 it was more than 47. Taking the group of shoes costing from $2 to $2.50 in 1914, it is found that a large proportion of these shoes retailed at $3.50 per pair; the same shoes in 1918 retailed generally at from about $5 per pair to as high as $7. The retailer's profits on this group of shoes in 1914 averaged about $1.07 per pair, while in 1918 they averaged $1.82 per pair. The retailer's percentage of profit on this group of shoes in 1918 was more than 50 per cent while in 1914 it was less than 47 per cent. In the next higher group—that is, shoes costing from $2.50 to $3 per pair—they sold generally at $4 per pair, while in 1918 the shoes in this group sold at prices ranging from $6 to $8 per pair. In the group of shoes that sold generally at $5 per pair in 1914, the price ranged from $6.50 to as high as $10 per pair in 1918.

In the case of women's shoes, the conditions were substantially the same. Shoes that cost around $2.50 to $3 per pair in 1914 brought from $4 to $6 in 1918.

Children's shoes that cost less than $1 per pair in 1914 and sold from $1 to $1.50 per pair, generally cost less than a third more in 1918, and sold at prices ranging around $1.50 to $2 and sometimes above. The group of children's shoes covering the bulk of the popular-priced good article cost an average of a little above $2 in 1914 and sold around $3, while the same shoes in 1918 cost well above $3 and sold around $5.

The most noticeable profits per pair are found in military shoes. Prior to 1917 the sale of these shoes was comparatively small. At the outbreak of the war this trade grew enormously and prices advanced to an unprecedented figure. For instance, an officer's military boot that cost $12 in 1916 and retailed for $18.50, cost $20 in 1918 and sold for $30. The shoe dealer in 1916 made a profit of $6.50 per pair on this boot, while in 1918 he made a profit of $10. While the percentage of profit based on cost was not a great deal larger on military shoes than other shoes, yet because of the higher first cost, the profits per pair were very much greater than in the case of any other class. There does not seem to be any justification for the enormous prices charged the officers and men of the Army for their shoes.

trade. In recent years there has been a demand for such a variety of styles of shoes as to increase the stocks of the average shoe merchant. This has resulted not only in the use of more capital, but it has added greatly to the odds and ends that must be sold at sacrifice prices at the close of each season. Any general advance in the prices paid for shoes increases the amount of necessary capital required if the usual variety of styles is carried. Any variation in the cost of conducting a business is at once reflected in the statement of profits and must be taken into account in considering the reasonableness of any changes in prices charged.

As already shown (see p. 153), the percentage of total sales necessary to cover the cost of selling shoes has remained practically without change during the last five years. As there stated, this does not mean that expenses have not increased, but it merely means that they have not increased at a more rapid rate than the volume of sales has increased. The volume of business as measured in money has greatly increased since 1914. There are not available any exact data as to changes in volume of business as measured by the number of pairs of shoes sold. From the best information at hand it seems safe to assume that the number of pairs of shoes sold in 1917 and 1918 was probably less than in the immediately preceding years. In the first place, some millions of men have been called into the Army and Navy and most of their trade was lost to the shoe merchant. In the second place, the extremely high prices tended to induce economy in the purchase of shoes by a large class of people. On the other hand, however, the smaller purchases of this class were at least partially offset by the increased buying ability of another class of people. There was a very great increase in wages and the wage earner probably bought as many or more shoes at the higher prices than he had formerly bought when prices were lower.

Taking into account all the factors above noted and considering all other circumstances, it is difficult to escape the conclusion that the shoe dealers, especially retailers, have charged more for shoes than they should.

CHAPTER VI.

GENERAL CONDITIONS IN THE LEATHER AND SHOE INDUSTRIES AND CONCLUSIONS OF THE COMMISSION.

I. THE HIDE BUSINESS.

Section 1. Competitive conditions in the country hide trade.

Particular inquiry was made among dealers in country hides as to the extent and character of competition in their business. The dealers seen were mostly those who finally distribute the hides to the tanners. It was impracticable to interview the large numbers of junk dealers and small merchants who buy hides direct from farmers and small butchers, though an appreciable number of the large dealers seen have agencies that deal direct with the primary owners of the hides. The hides taken off by the small butcher are often bought by the large dealer. The representatives of the Commission thus came in contact with all phases of the country hide business to a sufficient extent to form a fair judgment of conditions in the trade generally.

Some of the dealers were disinclined to discuss competitive conditions, apparently fearful that their expressions might be traced to them and their business injured by rivals. The great majority, however, gave free expression to their estimate of the character of competition they encountered in buying and selling. It was developed during the inquiry that in some sections of the country large dealers practically control the country hide business, while in other sections a larger number of buyers were active and competition was keener. The outstanding facts disclosed by these inquiries are: (1) That in large sections of the country the hides pass through two or three and sometimes four hands before they reach the tanners, while in other sections there is but one, or at most not more than two, dealers between the original owner of the hide and the tanner; (2) that in some sections of the country, notably in New England, Pennsylvania, and the Southwest, the business is dominated either by a single large tanning organization or by subsidiaries of the large meat packers. As already noted, this condition apparently does not exist in all sections of the country, but it does exist in some important territories. One of the most important sources of the supply of country hides is Texas, Oklahoma, Louisiana, and Arkansas. In

this territory the country hide business is largely in the hands of John Finnigan & Co., a subsidiary of the Central Leather Co. The headquarters of this hide company is at Houston, Tex. It has numerous branches throughout Texas and Oklahoma and some in Louisiana and Arkansas.

The Central Leather Co. also handles hides in Pennsylvania through another subsidiary, the Key Stone Hide Co. In New York and New England certain rendering companies controlled by the large meat packers handle great quantities of hides. They are especially active in the purchase of calfskins from small butchers, which class of trade is a part of the country hide business.

With respect to the character of competition, the information is not specific as to the methods employed, but there is a general unanimity of expression that in the southwest territory, including Texas and Oklahoma, the Finnigan Co. dominates the business and has resorted to methods that the trade considers unfair. A dealer in Memphis, Tenn., asserted that the small independent buyers throughout the South and Southwest were gradually being forced out of business by these methods. John Finnigan & Co. was pointed out as the principal cause of this condition. The network of subsidiaries and branches of the Finnigan Co. was alleged by this dealer to control practically all the country hides in the territory covered. He declared that the usual system adopted by Finnigan to drive out an independent buyer was to furnish capital to, or "grub stake," a local opposition buyer, instructing him to pay a few cents above the market price, thus forcing the independent concern either to lose money or quit business. As a result of this character of campaign the Finnigan Co. has obtained control of the country hide market in Texas, Oklahoma, Arkansas, and parts of Louisiana. Similar statements were made by others.

As already pointed out, the companies controlled by the large packers are extensive buyers of country hides in New England, and also in Pennsylvania and New York. A dealer at Philadelphia, Pa., said that in late years the packers have entered the country hide business, and in some instances have succeeded in controlling the situation. They have caused the complete elimination of some of the small country hide dealers. He said further, that this had been reflected in his business and that the result was that competition at country points was extremely keen and profits greatly reduced.

It should be pointed out in this connection that several dealers asserted that the result of the competition of the large buyers was to give the smaller hide dealers a better price, while others said that the large dealers, by their tactics, were driving out the small dealers and thus paving the way for securing hides at their own price.

A dealer at Hartford, Conn., declared that the large packers were gradually driving the New England butchers out of business, and that the farmers throughout New England, especially in Connecticut, were not raising as many cattle as they did some years ago. He stated that five years ago he purchased hides in New Hampshire, Vermont, and eastern New York, and shipped them to Hartford. His business would amount to probably 10 carloads a year, but he does not get that business now. This dealer stated that Swift & Co., through their various rendering plants, control the hide business in New England. Statements of this character were made by a number of dealers, and there is no doubt that the tendency in some sections is for the business to fall largely into the hands of the rendering companies controlled by the meat packers.

In the sale of country hides, there is competition. Each seller is active in competing for business. Some dealers complain that there is but little competition among tanners in the purchase of country hides. This was particularly true during the recent war period. During that time country hide dealers found themselves with large stocks of hides and no offers from the tanners.

Section 2. Control of packer hides.

With respect to the purchase of packer hides by dealers, no inquiry was made for the reason that the percentage of the total of such hides handled by dealers is comparatively small. About 75 per cent of all the cattle, and more than 65 per cent of the calves killed by wholesale slaughterers in the United States are killed by five large packers. The percentage of hides taken off is considerably greater than the percentage based upon the number of cattle for the reason that the cattle killed by the large packers are usually heavier than those killed by the smaller ones. The hides of many of the smaller slaughtering concerns are classed as country hides, though the quantity of these hides is comparatively small. At any rate, it is entirely safe to conclude that the five large packers control a larger percentage of the hides classed as packer hides than they do of the cattle slaughtered by wholesale slaughterers.

The large packer usually deals direct with the tanner or tans the hides himself. However, he will sell his hides to whomsoever will pay the highest price, but a dealer usually can not secure hides from the larger packers at any better price than the tanner can secure them, and consequently he does not handle them to any considerable extent. The bulk of the best hides are taken off by those slaughtering establishments that are engaged in interstate business. They handle the larger and finer cattle and consequently have the best grade of

hides. Of the cattle thus slaughtered, the five big packers kill about 82 per cent and more than 75 per cent of the calves.

It thus appears that five large packing concerns have practical control of the grades of domestic hides that are in highest demand and that are reputed to produce the best classes of leather. They have a large proportion of the hides that enter into the heavier leathers, such as sole and harness. At times this enables them to exact the highest possible prices that the tanner can afford to pay. There are other times, however, when the demand for hides is slight and the supply is large; there is competition among the large packers in disposing of their product. Having more than 80 per cent of the class of cattle hides that is in greatest demand, taken in connection with the fact that the packers themselves are extensively engaged in the tanning business, enables them to have a large degree of control in the domestic hide market.

It may be suggested that an important competitor of domestic hides are those imported from South America. The importance of this competition is greatly minimized when it is understood that a large proportion of the South American hides available for import are owned by those who also control the packer hides in this country. This is especially true of the heavier grades of hides.

In those classes of hides which enter into the lighter leathers there is not the same degree of control in the hands of the packers as in the heavier grades. Country hides compete to an extent with the light cow hides and calfskins of the packers.

II. THE LEATHER INDUSTRY.

Section 3. Evolution of the tanning industry.

The tanning business has gradually developed from a neighborhood industry to a comparatively well-organized and centralized business. Half a century ago there were more than 7,500 tanning establishments in the United States. In 1914 (the latest date for which comparable figures are available) there were less than 750 establishments.

At the earlier date, and more especially during the period preceding it, there was a tannery in almost every community where tanning material was available and where the population warranted it. The principal and in many cases the only material used for tanning was the bark of the oak, chestnut, or hemlock. Chemicals and imported tanning materials were for a long time unknown. The industry being thus restricted to regions furnishing bark, there grew up a trade in leather between those communities having tanning materials and those that did not. The sections of the country producing no leather exchanged hides in part payment for their leather requirements.

In those early days, especially in rural communities, the farmers did not buy ready-made shoes to any appreciable extent, but had

them made by a shoemaker in the neighborhood. If the farmer killed an animal he took the hide to the tanner, who would convert it into leather, usually the charge being for side leather, a part (generally half) of the finished leather. A light hide was converted into upper leather and a heavy one into sole leather. Sometimes the tanner bought the farmer's hides outright. The small tanneries made all classes of leather then in general use because they tanned all classes of hides.

While the industry was in this primitive state of development, the neighborhood tanner produced nothing but finished leather. Gradually the industry developed, keeping pace with the development of industry in general. The tanning properties of bark were extracted and these extracts could be transported distances over which the cost of transportation of bark was prohibitive. This made it possible to conduct the business on a larger scale and to locate tanneries more remote from the sources of supply of tanning materials. In the meantime other tanning materials and new processes of tanning were discovered and the art of finishing leather was greatly advanced. The old neighborhood tanner finished the skins in exactly the condition they came from the vats. He knew nothing of coloring, and all his product was finished either in black or the natural color. It was discovered that a hide could be split and made to produce leather of a practically uniform thickness. This not only produced more desirable leather, but it furnished a by-product of splits that was useful for many purposes where grain leather was too expensive. Comparatively simple and cheap processes of making leather of any desired color were discovered. These two developments greatly popularized the product of the larger and better organized tanneries, and the neighborhood tanneries began to diminish in number. They could not make leather to compare in appearance, and oftentimes in quality, with that produced by the new processes. Many of the small tanneries under these circumstances discontinued finishing the leather and sold the rough product to large finishing concerns. In the meantime the cost of production in the larger tanneries became so much lower than the cost in the small neighborhood tanneries that most of them disappeared entirely. The result was that within 50 years more than nine-tenths of the tanneries of the United States disappeared entirely, and those disappearing were replaced by large, well-organized concerns.

Section 4. Organization of the industry to-day.

As constituted at the present time, the industry is highly organized. Discoveries in processes shortened the time in which hides could be converted into salable leather, and the invention and use of labor-saving devices greatly reduced costs. In a few instances

there is a kind of integration in the industry. Some tanning concerns produce their own extracts and own the forests that supply the bark from which these extracts are made. This is not general, however, and probably never will be, because of the large capital required and because it makes necessary a lumber business incident to the tanning industry. These conditions, coupled with the fact that bark-producing forests have increased in value, no doubt deter many tanneries, especially the smaller ones, from engaging in the extract or bark business. There is a further integration in the manipulation of the finished leather. There are a number of concerns in the United States that make a business of cutting up leather, particularly sole leather, to meet the requirements of shoe manufacturers and shoe-repairing establishments. Some tanners have engaged in this cutting business and produce large quantities of cut stock.

Specialization in the industry.—In the development of the industry there has come about a considerable degree of specialization. There are nearly a dozen distinct classes of leather, the principal of which are sole, harness, side upper, calf and kip, kid, sheep, and upholstery. The bulk of the leather in some of these classes is produced in tanneries that practically make but one class or two closely related classes. Many tanneries, for example, produce sole leather almost exclusively, but make some other heavy leathers, such as harness leather and belting leather. These other heavy leathers differ from sole leather mainly in the finish or in the manner of cutting. These tanneries, as a rule, do not make the lighter leathers. Many tanneries make practically nothing but upper leather, but include side upper and calf and kip in the group. Some make only calf and kip. Tanneries that make kid or sheep leather often produce no other kind. There are some notable exceptions to this general practice. A few important concerns make a half dozen different classes of leather, including both heavy and light, and also include in their upper leather class those leathers made from the hides and skins of cattle and those made from the skins of goats and sheep, but the general rule is to specialize.

Section 5. Concentration in the industry.

There is a marked geographical concentration in the tanning business. According to the United States census of 1914, more than 72 per cent of the leather, measured by its value, was produced in six States, as follows: Pennsylvania, Massachusetts, Wisconsin, New York, New Jersey, and Michigan. These States rank in the order named, and no other single State produced as much as 5 per cent of the total product of the country. Pennsylvania produced nearly one-fourth of the total, and the three States of Pennsylvania, Massachusetts, and Wisconsin together produced 47 per cent of the total

production in the United States as measured by its value. The chief reasons for the concentration of this industry in these three States appear to be that Pennsylvania and Wisconsin offer peculiarly advantageous inducements as to tanning materials and Massachusetts was a great center of the shoe-manufacturing business and offered peculiar inducements as to market.

Concentration with respect to control of the industry is only slightly less marked than the geographical concentration.[1] In 1917 the total production of sole leather was, in round figures, 465,000,000 pounds. More than 52 per cent of this quantity was produced by the Central Leather Co., the Michigan Tanning & Extract Co., Armour & Co., and Endicott, Johnson & Co. The Central Leather Co. alone produced about 33 per cent of this total, while the three next largest produced 14 per cent, the difference between the highest and lowest production of these three being only about 3,000,000 pounds.

The production of upper leather, not including patent or glazed leathers, in 1917 was, in round figures, 596,000,000 square feet. Of this production 419,000,000 square feet was calf, kip, and side upper made from the skins of neat cattle, and the balance consisted of miscellaneous kinds, such as sheep, goat, horse, etc. Of this class of upper leather, commonly known as regular or plain upper leather, about 27½ per cent of the total was produced by four corporations or their subsidiaries. It is thus seen that the figure of concentration in the control of the plain upper leather branch of the industry is not nearly so great as in sole leather. These four concerns have greater control of kip and calf than they have of side upper. Of the former they produced over 55 per cent and of the latter 30 per cent. Kip leather, however, constitutes a small percentage of the total plain upper leather. Calf and kip combined constitute about 20 per cent of the plain upper leather, and the four concerns referred to above produce 40 per cent of the total calf and kip.

The total production of glazed kid and goat leather in the United States in 1917 was, in round figures, 230,000,000 square feet. This is nearly 88 per cent of all the glazed leather made in that year, the balance being made from sheep and various other kinds of skins. More than 46 per cent of the glazed kid and goat leather was produced by five companies or their subsidiaries, and more than 25 per cent of the total was produced by two companies.

[1] The figures used in this discussion of concentration of control are not exact. The departure from absolute exactness is due mainly to the fact that some tanneries reported leather in pounds that is ordinarily measured in feet, and others reported their production in feet that is ordinarily measured in pounds. The conversion of the product of the production of these few tanneries may result in slight error, but it is not serious and does not appreciably effect the percentages used.

The production of upholstery leather in 1917 was about 105,000,000 square feet. Of this total 46 per cent was splits, 20 per cent grain, 16 per cent buffing, 13 per cent auto leather, and the remainder miscellaneous kinds of upholstery leather. Of the splits, which were nearly half of the total, 55 per cent was made by five corporations or their subsidiaries. Of the buffing leather, over 85 per cent was made by five corporations. Approximately 75 per cent of the grain leather was produced by five corporations, and three of these were among the five largest producers of split upholstery leather. All the auto leather made in the United States in that year was produced by five concerns and more than half of it by the Wilder Tanning Co. alone. These various classes of upholstery leather are more completely controlled by a few concerns than any other class of leather.

Nearly half of the glove leather produced from sheep and lamb skins in 1917 was made by J. G. & Thos. Robinson. Out of a total of 87,000,000 feet this company produced nearly 43,000,000 feet. It should be said in connection with this fact that the remainder of the glove leather made from sheep and lamb skins was produced by about 40 different individuals and corporations.

The above survey covers the principal kinds of leather in general use. Notwithstanding this marked control in some of these classes, there was no evidence obtained by the commission indicating that this control resulted in a stifling of competition. Outside of a very few special classes of leather there are usually found a number of tanneries producing several kinds.

Section 6. The meat packers as a competitive factor in the leather industry.

In order to have an intelligent understanding of the competitive position that the large meat packers occupy in the leather industry, it is necessary, as a preliminary, to understand the extent to which the hides consumed by the industry are produced in this country. According to a pamphlet [1] recently published by the Tanners' Council of the United States, nearly half of the leather produced in this country during the last few years was made from imported hides. The following tabular statement is reproduced from that publication:

	1915		1916		1917	
	Imported.	Domestic.	Imported.	Domestic.	Imported.	Domestic.
	Per cent.	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*	*Per cent.*
Cattle	47.5	52.5	45.8	54.2	44.7	55.3
Calf	52.3	47.7	53.0	47.0	40.5	59.5
Sheep	65.9	34.1	75.1	24.9	73.5	26.5
Goat	99.0	1.0	99.1	.9	99.1	.9
Kangaroo	100.0	.....	100.0	.....	100.0	.....

[1] World's Trade in Hides, Skins, and Leather.

One of the striking facts disclosed by the foregoing statement is the importance of imported hides to the industry. This is especially true with respect to sheep and goat skins. A little more than half of the cattle hides used in the three years ending with 1917 were of domestic production, while less than half of the calfskins were domestic. In 1916 and 1917 about 75 per cent of the sheepskins were imported. In 1915 about two-thirds of the sheepskins used in the tanneries of the United States were imported. Practically all the goatskins and, of course, all the kangaroo skins are brought to the United States from foreign countries.

The five large meat packers have become a considerable factor in the leather business, and their power and influence is rapidly increasing. Of the slaughterers engaged in interstate commerce these five concerns and their subsidiaries kill 82 per cent of the cattle and 79 per cent of the calves. They slaughter about 75 per cent of the total cattle and calves slaughtered by wholesale slaughterers (both local and interstate). The proportion of hides they produce is undoubtedly in excess of the proportion of cattle they slaughter for the reason that the average weight of cattle slaughtered by these large packers is greater than the average weight slaughtered by the smaller ones. These figures do not take into account country hides which constitute a considerable proportion of the total supply of domestic hides. The hides produced by these packers are generally of uniformly more desirable quality than those taken from cattle slaughtered by the smaller packers because they have more skilled employees for taking them off and better facilities for handling and curing them. Four of these packers produce a large percentage of the South American cattle hides that are available for importation into this country. It is thus seen that they control a very large percentage of the supply of hides available to American tanners and especially those hides of the more desirable class.

Two of these packers are large producers of leather. Two others are important producers and the fifth one has recently entered the tanning business. In addition to the tanneries that they own and operate themselves, some of them have large quantities of leather tanned under contract in tanneries that they do not own. In 1917 one of them (Armour & Co.) produced in its own tanneries one-fifteenth of all the sole leather made in the United States in that year. Another packer (Swift & Co.) is a very large producer of upper leather. The others are constantly increasing their comparatively small leather production.

This situation raises a serious question as to how far this extensive encroachment on a basic industry in which they virtually control the raw material is safe for the public interest. They can place every tanner using the more desirable grades of hides, particularly

the heavier hides, in a position of paying the price that they may ask or of taking the risk of encountering further competition in the leather industry from them. They may not be able to put a tanner out of business at once, but they have the power to do it if they are so disposed. Even the Central Leather Co., which produces about one-third of all the sole leather made in the United States, can not successfully remain in business without packer hides, and if the packers should conclude it to be to their advantage to extend their activities in the production of sole leather, even this largest of all sole leather manufacturers in the United States could not withstand the competition it would encounter.

Section 7. Accounting methods of the tanners.

During the course of this investigation, and especially in the accounting work that was undertaken during the war for the War Industries Board, the Commission found it necessary to scrutinize closely the accounts of the tanners. It is a remarkable fact that such an extensive and well-organized industry was found to be lacking in accurate accounting methods. This was particularly true in the side upper-leather branch of the industry. It developed that some of the largest producers of upper leather did not have accounting records from which could be ascertained their cost of producing leather. In the sole-leather branch of the industry and in the calf and sheep skin branch accounting methods were better. In fact, a considerable number of tanneries engaged in the production of heavier leathers were found to have most excellent cost records.

There are inherent difficulties in establishing systems of cost accounting in some branches of this industry. This is especially true of the upper-leather branch. In the manufacture of side upper leather there is produced a great quantity of splits which are a by-product of the main business. Furthermore, some upper-leather tanneries produce great quantities of calf and kip leather in the manufacture of which very few splits are produced. The production of these various kinds of leather was frequently so intermingled that it was impossible to segregate the cost of producing each particular kind. To this is added the difficulty of ascribing a value to splits. It is frequently the case that this by-product does not have a regular market value, thus making it extremely difficult to attribute a value in the cost of production that is safe for the tanner to adopt.

Furthermore, as noted elsewhere, a few of these tanners produce their own extracts. Some of them charge these extracts to the tannery at cost and others charge them at the market price. This involves a necessary adjustment in arriving at the true cost for manufacturing leather. In addition to this, there is the difficulty of distributing fixed charges and general expense among the various classes of leather produced upon an equitable basis.

Notwithstanding these difficulties, it is possible to devise a system of cost accounting for each branch of the industry that will give a practically true cost for each class of leather made. When some of the largest tanners were unable to furnish records from which costs could be ascertained, and they were consequently excluded from any consideration of prices based on cost by the War Industries Board, they realized the seriousness of their situation and the importance of adopting better systems of accounting. The Federal Trade Commission, after conference with the auditors and cost accountants of a number of companies, suggested methods of accounting that are in large measure being adopted by many of the most important tanners of the country. In this work of devising cost systems the Commission had the hearty cooperation of the tanners' council of the United States, and the council has employed an expert accountant to advise with tanners as to the best methods that may be employed. It is certain that the adoption of these better accounting systems will be of great benefit to the industry.

III. THE SHOE INDUSTRY AND THE SHOE TRADE.

Section 8. Centralization in the industry.

There is a marked geographical concentration in the boot and shoe industry, but no significant concentration of control. In 1914 [1] there were reported to the Bureau of the Census 1,248 establishments in the United States producing boots and shoes as a regular factory product, and 107 establishments making overgaiters, moccasins, and leggings, doing contract work or specializing in certain operations, such as stitching, crimping, or making buttonholes, making a total of 1,355 establishments engaged in what may be called the shoe-manufacturing industry. Of this total number of establishments, a little more than 40 per cent were in Massachusetts. New York followed with slightly less than 14 per cent, and only one other State, Ohio, had as much as 7 per cent.

Perhaps the best available measure of the relative importance of this industry in the various States is the value of products. Measured by this standard, 81 per cent of the total production in the United States in 1914 was found in six States, these States comprising all those that had 5 per cent of the total value of products or more. In the order of importance, these six States are Massachusetts, with 40 per cent; New York, 13.4 per cent; Missouri, 8 per cent; New Hampshire, 7.5 per cent; Ohio, 6.5 per cent; and Pennsylvania, 5.5 per cent.

There were only six other States that had more than two establishments each. Of the 1,355 establishments, there were 121 found in

[1] The figures used in this section are taken from The Leather Industry, Census of Manufacturers, 1914.

States that had only one or two each. These 121 establishments produced less than 4 per cent of the boots and shoes manufactured that year as measured by the value of products.

During recent years there has been a tendency to a growth of large establishment. In 1914, 53.5 per cent of the total value of products were found in establishments each of which had a product value of $1,000,000 and over, and 96 per cent of the total value of products was found in establishments each having a value of $100,000 and over, leaving only 4 per cent in establishments having less than $100,000 each. The groups of larger establishments, i. e., those having a value of products amounting to $100,000 or more each, represented 52 per cent of the total number of establishments. As indicating the extent to which the complete product is manufactured in individual establishments, it may be stated that the concerns making complete boots and shoes had 99½ per cent of the product and represented 92 per cent of the total number of establishments.

Section 9. Competitive conditions in the industry.

There are several important competitive factors in the production of shoes. The most important from a utilitarian standpoint is quality. The business has reached such a high state of efficiency in this country that it can not be said that one manufacturer produces a better shoe, from a utility standpoint, than is produced by a number of its rivals. Style is a very important competitive factor, and here, too, there does not appear to be any one or any few concerns that conspicuously outclass others. In addition to these two principal competitive factors, there is the factor of service, conditions of sale, and others.

Section 10. Methods of distribution.

In a schedule sent to all the shoe manufacturers of the country they were asked to indicate the channels through which they distributed their shoes. From these schedules there were found 730 which contained answers that definitely defined the channels of distribution. These 730 factories, in 1917, produced more than 293,000,000 pairs of shoes. Almost exactly half of the shoes reported by these companies were sold direct to the retailer. A little more than 42 per cent were sold through wholesalers and jobbers. Approximately 2 per cent was sold to the consumer direct, and a little more than 5 per cent was sold through stores owned and operated by the manufacturer. It is probable that complete figures from all the manufacturers would show only a slight variation from the above percentages. One or two comparatively important manufacturers that operate their own stores did not make satisfactory reports, and

this might vary the figures slightly. The largest manufacturers sell the bulk of their product direct to the retailer. Many of these sales are made upon orders, that is to say, the retailer orders his shoes six months or more ahead of the season and frequently specifies the kind of shoes desired. The regular wholesaler also frequently orders shoes made to specifications. The jobber proper usually handles lots of shoes ordered by merchants but not taken from the manufacturers and any overproduction that may have resulted from a failure to sell the entire output to wholesalers or retailers.

Section 11. Effect of Styles on Prices.

Among the large number of shoe dealers interviewed, both wholesalers and retailers, there was general unanimity of opinion that style has been a very important factor contributing to the increased cost of shoes to the consumer. This is especially true in respect to women's shoes. In recent years there has been a pronounced disposition on the part of women to give shoes an added emphasis in her category of adornment. The shape of the toe, or the heel, or the height of the shoe, or the color of the leather—one, and sometimes all of these, often is the chief consideration in determining a purchase.

The introduction of new and multiplied styles created a new demand for shoes, especially among women. As just indicated, shoes have become as much an article of adornment as of utility, and with some, more so. Styles are continually changing and to follow the fashion, footwear is often not worn as long as it will give service but only as long as the style is correct. These changes in vogue, both as to the shape and cut of the shoe, and as to height, and also as to color of the leather, frequently change twice a year and it is rather unusual in novelty shoes to find a style that will live through more than one year.

From the testimony of dealers it is apparent that this demand, created by fashion, has great influence in inflating the prices of novelty shoes, which class of footwear constitutes a very large proportion of women's shoes. A shoe merchant is obliged to carry a stock of various styles, and the constant change in these styles results in the risk of having large stocks of goods left on his hands that must be disposed of at a sacrifice when the style is no longer popular. Some merchants go so far as to declare that the advance in the prices of women's shoes is principally due to style. Some of these changes in style result in added cost to the manufacturer, to say nothing of the added risk that must be incurred by the merchant. Five or six years ago the average height of women's shoes was probably not more than 6 or 7 inches, whereas in 1917 and since the

average height is probably from 8 to 9 inches. The cost of colored leather of the more delicate shades is greatly in excess of leather of black and plain colors of similar quality. Each piece of the upper must be carefully matched, and there is the added expense of waste due to this matching in the cutting of the uppers.

Many dealers class women's footwear with millinery, and some designate it "foot millinery" because of the frequent changes in style and because of the effect that style has on the demand. They declare that the high prices of shoes lie in the fact that whereas a woman formerly bought a plain shoe, ordinarily made in great quantities of plain black or tan material, she now desires a high boot of beautiful color, made of superfine and perfectly finished leather and made over the most difficult and slender last.

The chief justification for the high prices obtained for women's fancy shoes is the fact of the large stocks that have to be sacrificed when the styles change. It is generally conceded that if fewer styles were made the public generally would be better off, and the shoe dealer would not be compelled to require what is often considered an exorbitant profit upon fancy shoes in order to protect himself against loss on remnants that are no longer in style. While this is true, there are many retail shoe merchants who claim that their business has been greatly stimulated by the multiplicity of styles. They assert that formerly a woman might have only two or three pairs of shoes, while now many of them have a separate pair of shoes to match the color of each gown she wears. This has added greatly to the volume of business of the shoe merchants.

This effect of styles upon prices of shoes as discussed by these merchants applies only to fancy shoes. They do not offer this as an explanation of the increase in the price of ordinary staple shoes made in styles that do not change at all, or if so, at very infrequent intervals. It may be contended that plain shoes bear a part of the burden of risk incurred by the handling of novelty shoes, though from the figures already discussed in Chapter IV this would not seem to be the case. No figures were obtained for cost and selling prices of novelty shoes, for the reason that styles change at least once and often twice a year, and it was not possible to secure figures that would be comparable from year to year. It will be recalled that the percentage of profit made by the retail shoe dealer did not change greatly between 1914 and 1917. In other words, the percentage of profit on standard shoes was frequently no greater in 1916 and 1917, when novelty shoes were such an important factor in the trade, than they were in 1914, when they were a less important factor.

Section 12. Comparative quality of shoes in 1914 and 1917.

According to statements made by many shoe merchants, the quality of shoes, as a general rule, materially deteriorated between 1914 and 1917. Practically the only exception was in cases where shoes were made on orders and according to specifications. This deterioration was due to the use of a poorer quality of leather in shoes of the same nominal grade, to inferior workmanship, and to the substitution of other materials for leather. Merchants do not generally attach blame to the manufacturers for these conditions, but generally attribute it to circumstances over which no one had control.

The use of inferior leather is alleged by some to have been due to the demand of foreign governments and of our own Government for unusually large quantities of the best grades of leather for Army use, and to the fact that the heavy demand for all classes of leather compelled tanners to shorten the time of tanning at the expense of quality. Others allege the use of poor leather to be due to the desire of shoe manufacturers to reduce costs. Substitutes for leather were often used to keep down costs, and thus quality was sacrificed. Fiber and composition material were in some instances substituted for leather in counters and other parts in grades of shoes that theretofore had always contained leather in these parts.

Numerous specific instances of deterioration in quality were brought to the attention of the Commission. A wholesaler stated that a shoe he was then selling for $5 was, in his judgment, not as good, either in material or workmanship as the shoe of the same nominal grade was when he sold it a few years ago for $3. Another stated that shoes that cost less than $2.35 in 1915 were superior in quality to the same nominal grade that cost $3.75 in 1917. One wholesaler mentioned a particular shoe, which he declared had more satisfactory wearing qualities in 1914 when it cost only $1.40 than it did in the spring of 1918 when it cost $3.10. It was emphasized by a number of wholesalers that notwithstanding greatly increased prices, there had been deterioration in both quality of material and workmanship. One merchant asserted that a shoe in 1917 was not as good as was a shoe of the same nominal style and grade when it sold for half as much four or five years ago.

The opinions of retailers were in harmony with those expressed by wholesalers. There was a general unanimity of expression that the quality of staple shoes during the prewar period was superior, both in material and workmanship to the quality of shoes of the same nominal style and grade during the war period. A certain shoe which sold for $10 in 1918 was declared by the merchant not to be as good as when it sold for $6 in 1914. Another concrete instance was cited of a particular woman's shoe which was, in 1917, selling

for $8 and was inferior to the same shoe which sold for $4 in 1914. A similar statement was made with respect to a shoe which formerly sold for $4 and was in 1917 selling for $7.50. This merchant stated that at the latter time the shoe did not have as good material in it. This same merchant cited an instance of a tan shoe which he formerly bought at $2.85 and for which he was then paying $5.25 that was inferior in the quality of the material used in the shoe for which he paid the higher price. Instances of this character might be multiplied indefinitely. These are typical, and basing a conclusion upon the judgment of merchants generally, it is evidently a fact that notwithstanding the greatly increased cost of shoes to the consumer, the quality was far inferior during 1917 and 1918 to the shoes of the same style and of the same nominal grade that were bought in 1914 and 1915.

IV. CONCLUSION.

Section 13. Importance of a better system of handling and marketing country hides.

Country hides constitute an important proportion of the domestic supply. They are now taken off and handled in a most inefficient and wasteful manner. In taking them from the animal they are frequently cut or scarred and often pieces of flesh are left on them. The former obviously reduces the value and the latter frequently interfers with good curing and adds weight that must be allowed for in the sale, and at the same time frequently results in decreasing the value of the hide. Care would remedy much of this inefficiency and add materially to the value. Farmers and small butchers feel, however, that there is no incentive for them to exercise more care in taking off and handling hides because usually the buyer makes no discrimination in price between those hides that are carefully removed and cured and those that are not. There is some justification of this attitude of the farmer and small butcher.

Methods of marketing country hides have already been described. (See p. 10.) The prevailing custom of buying in round lots usually results in a disadvantage to the original owner who exercises care. This system of buying is not only unjust, but it discourages care in removing hides from the animals and results in an enormous absolute waste of a constantly diminishing supply of the chief raw material in an essential basic industry.

It would seem that efforts to correct the inequities in the country hide business must be initiated at the top; that is, with the large hide dealer who sells to the tanner. When the dealer sells to the tanner he grades his hides carefully because he can not sell them otherwise. There should be devised some means of having the dealer also buy by grade. If he would make his purchases by grad

from the small dealers and merchants, they would probably be compelled to adopt the same method in buying from the farmer and small butcher. These farmers and small butchers would soon learn that their hides were sold by final distributors on grade and they would insist on those who buy from them discriminating between the perfect and imperfect, or between the superior and inferior. The difference in price received for a good and a poor hide would stimulate care in taking off and curing.

There seems to be no reason why the unsatisfactory conditions in this business can not be, at least largely, corrected and great waste thus eliminated. Failure on the part of dealers sincerely and earnestly to attempt to bring about a more equitable system can not be excused. Some large dealers now buy at least a part of their hides by grade. There is no reason why all might not do so. Not to do so would indicate a desire to continue the present system because it is profitable, and furthermore, it will indicate a lack of desire on the part of dealers to conserve and add to the real value of a large proportion of an important and necessary raw material in the tanning industry at the sacrifice of the public interest for the sake of personal gain. It may be argued that the country merchant and junk dealer can not properly grade hides. It is probably true that most of them will be unable to discriminate as closely as the experienced buyer of the large dealer, but it is also true that they can readily discern the difference between a very good hide and a very poor one. The farmer and the small butcher are entitled to a fair value for their hides based upon quality.

The adoption of a system of buying on grade will result not only in giving the original owner a more equitable price for his product, but what is perhaps more important, it will result in adding to the quantity of good leather that can be produced in this country. Not only will the quality of good leather thus be increased, but the absolute quantity will be increased. When the shoe manufacturer cuts a piece of leather made from a hide that is cut or scarred, there is always some waste. This waste frequently occurs in that portion of the skin that would be expected to produce the best quality of leather. There is, therefore, the double incentive for greater care: (1) The incentive to give the original owner a more equitable price for his product, and (2) to increase both the quantity and quality of the leather supply.

Section 14. Economies possible in the shoe manufacturing business.

As at present conducted, there is considerable waste in the manufacture of shoes. This waste in some measure grows out of the laudable desire to stimulate business. This situation has no doubt generally resulted from competition and not from any ulterior motives.

The general public would benefit if shoes should be more completely standardized and made in fewer styles.

Styles have grown in numbers out of proportion to any possible advantage, either as to utility or as to appearance. Perhaps the greatest opportunity for economy in the industry would result from a reduction in the great variety of shapes. Each shape requires a different last and lasts are an important item of expense in the production of shoes. It is often the case that the difference in the shape of two styles of shoes is so slight as to be scarcely noticeable, but however slight, each style requires a separate last. Even with only a few shapes, a great number of lasts are required because there must be a separate last for each size and the production of a variety of sizes is absolutely necessary. Each unnecessary shape of shoe, therefore, adds that much unnecessary burden to the industry and contributes nothing to the comfort or convenience of consumers, if, indeed, it adds anything to the adorning qualities of the shoe.

There is also useless waste in the variation in the cut of shoes. Shoe uppers are cut to pattern and the slightest variation in cut requires a separate pattern. In the case of women's shoes especially, the diversity of patterns is very great and the burden to the factory is correspondingly heavy.

It would seem that the diminishing of styles should appreciably add to the efficiency of workmen. In the manufacture of shoes there is great specialization in labor, much of which requires the highest skill. The man who makes the heel does nothing else. The man who finishes certain parts of the shoe does nothing else. Variations in style, no doubt, require a wider range of skill and therefore a reduction in the number of styles, it would seem, should add to the efficiency of workmen in general.

Blame does not attach to manufacturers for existing conditions. Frequent changes in, and multiplicity of styles resulting in a burden to the industry without any compensation except to please a fancy, are responsible. This devotion to fashion has a tendency to take the mind of consumers from consideration of utility and to direct it mainly to consideration of style.

It is believed that a reduction in the number of styles would not only contribute to economy and efficiency in the production of shoes, but that it would not take away anything from their utility or materially diminish their beauty. The economy thus brought about might not greatly affect the price of shoes to the consumer, but it should do so at least to a degree. In the aggregate it would save a large sum to the manufacturing industry. Perhaps its chief benefit and advantage would be in reducing the capital investment of shoe merchants. The more styles of shoes that a merchant carries, the greater must be his investment. Furthermore, it would mate—

rially reduce the odds and ends that merchants must sell at a sacrifice at the end of the season. This should enable the shoe merchandising business to be conducted on a smaller margin of profit. The merchant would not have to add so much for profit on staple shoes and on seasonable goods in order to compensate himself for losses on remnants because he would have fewer remnants.

If the number of styles were reduced, there would probably be a reduction in the number of pairs of shoes sold, and a saving to the public as well as a conservation of supply would be effected. The production of leather is not likely to increase because there is no probability that there will be an increase in the production of hides and skins. New uses for leather are constantly being found and the demand for this product is constantly increasing. That this is so is evidenced by the great variety of things that are now used as substitutes for leather. It seems that any steps that will result in conserving the supply of leather and adding to the utility of the existing supply, are highly desirable in the public interest. It is also desirable from a broad economic standpoint that all the capital unnecessarily employed in one line of business should be released for other businesses.

Section 15. Desirability of uniform and better accounting methods.

The accountants of the Federal Trade Commission encountered great difficulty in obtaining accurate costs of production from the books of tanneries. In a much less degree this was true in regard to shoe manufacturers. Not only was there difficulty in ascertaining details of cost, but as great difficulty was often encountered in determining investments and earnings. The two sources of difficulty found were: First, and most important, such defects in accounting methods as to make it impossible to ascertain accurate costs or to determine accurately the actual investment and earnings; and, second, there was often such a lack of uniformity in accounting systems as to make it difficult or even impossible to arrive at results that were comparable.

The matter of proper accounting methods and the desirability of uniformity in these methods are so important as to warrant pointing out in some detail more specifically the defects found. In cost accounting the chief difficulty encountered was due to a lack of proper classification of details and of reasonably accurate methods of allocating general and administrative expenses. The purpose of cost accounting, if it is to be of value, is not only to enable the manufacturer to know the total cost of the commodity he produces, but to know the cost of well-defined operations and processes.

In the case of labor it was frequently found that no separation had been made or could be made between direct and indirect labor.

With the labor employed in the immediate production of the commodity there was often shown labor that applied to the operation of the plant as a whole. The cost of repairs sometimes included both the labor and the value of the materials used in making them. While this is not a serious defect, it should be avoided wherever possible.

Some companies in the tanning industry produce part of their tanning materials in separate establishments. These materials are sometimes charged into the tannery at the market price and sometimes at cost, and sometimes at a price falling between the market and cost price. The charging of these materials in this varying way obviously leads to more or less error in the actual cost of the product.

Items of general expense were sometimes found not to be included in costs at all, but carried directly to the profit and loss account. Administrative expenses were frequently not properly allocated as between manufacturing and selling. Federal taxes were often found in manufacturing expense, and this is also true with respect to interest. These two items are in no sense elements in the cost of production.

Depreciation is a proper charge against the cost of production, but there were instances in which no such charge was found. In some cases depreciation was charged against earnings and in some not charged at all. It was often found that this charge when made was not based on any sound principle. It should be based on the cost and life of depreciable property. It is often based on what may be called expediency. If the business is very profitable, the depreciation charge is frequently large; if it is unprofitable, the charge is light or even not made at all. Furthermore, the books of some companies do not show the actual value of property, and even when based upon the book value of the property and the life of this property the depreciation charge is erroneous.

Equally as serious a difficulty was met in determining the rate of return on investment as was found in ascertaining accurate costs of production. This was due to the failure of the books of companies to show actual investment and, in a less degree, to supply such data as would enable accountants to determine the actual earnings. Book values of property frequently do not show even approximately either the cost of the property or its real value. These property accounts are sometimes balances after heavy depreciation charges have been deducted. In other cases no deductions of any character have been made. Some tanning concerns are engaged in other lines of business or are producing materials used in their main business, and balance sheets do not always show definitely the amounts invested in these separate businesses.

The manner of preparing statement of earnings often made it difficult to determine accurately what the earnings were, and in some

cases this was actually impossible. In nearly all cases considerable work was necessary in making adjustments in earning statements and profit and loss accounts in order to secure accurate data.

The above were the principal deficiencies found in accounting systems. It should be pointed out in this connection, however, that the defects herein noted are not peculiar to these industries but they were found in most of the industries into which the Federal Trade Commission has had occasion to examine. Until the Federal Government during the recent war found it necessary to ascertain costs in order that understandings might be reached with respect to fair prices a large number of leather manufacturers and others did not appreciate the value of accurate cost accounting.

Lack of uniformity in systems of accounting added greatly to the work of the Commission. In some instances it was possible to make adjustments, while in others it was not. For the purposes of the Government, approximate uniformity in accounting is necessary. In fact, such uniformity is absolutely essential in the preparation of statistics purporting to show conditions in the industry. For the industry itself a lack of uniformity may not be so important, but even here it is of importance if the statistics compiled by the Government are to be of value. Every five years the Bureau of the Census requires certain information from manufacturers. At frequent intervals other Government agencies find it necessary to require even more detailed information than is essential for the purposes of the census. The census statistics should be of great value to industry as well as a source of useful information to the public generally. The value of these statistics is greatly diminished because of a lack of uniformity of accounting methods in each particular line of business.

As already pointed out, the lack of proper accounting systems and of uniformity in accounting is not peculiar to the leather and shoe industries and what has been said here applies in very large measure to industry in general. The accounting deficiencies are probably as pronounced in the tanning industry as in any large industry that the Commission has investigated. They are certainly far more pronounced in this industry than they are in the boot and shoe industry. The principal tanners of the country, however, are fully alive to the importance of a better system of accounting and of uniformity in that system, and have taken steps through one of their organizations to remedy the evils here pointed out. As has been already stated (see p. 164), the Commission has cooperated with the tanners by way of suggestion and all suggestions made have been considered in a spirit that shows an earnest desire on the part of the leaders in this industry to adopt a system of accounting that in the future will enable not only themselves but the public and the Government to know accurately the conditions of the industry.

Section 16. The causes of the advance in the price of shoes and a comparison of these prices, with profits.

The two main questions expected to be answered by this inquiry are whether or not the prices paid for shoes by the public during, and just prior to the entrance of the United States into the war of 1914–1918, can be justified, and if not, where the responsibility lies for the increase. In a single sentence the answer is that under all the circumstances there can be no justification for prices being as high as they have been, and that the tanners of leather, the manufacturers of shoes, and retail shoe dealers made profits not warranted by the circumstances. This conclusion takes into consideration the fact that prices of shoes were bound to advance considerably between 1914 and 1917. The extraordinary demand for leather increased the value of hides; there was an increase in the cost of all materials used in the manufacture of leather; there was a notable advance in the cost of labor, all of which contributed to the increased cost of leather to the shoe manufacturer. The shoe manufacturer in turn was forced to pay more for leather, more for materials other than leather and more for labor as the war progressed. These factors all contributed to the advance in the cost of shoes to the consumer.

It is not to be understood that those engaged in the industries here under consideration, and the merchants engaged in this branch of trade are the only manufacturers and merchants who have made unprecedented profits during the war period. Speaking broadly, great profits generally have been made in industry and trade during the war, even before this country became a belligerent. So in this respect leather and shoe manufacturers and shoe merchants are no different from others. Between the tanners and shoe manufacturers, the former as a class, enjoyed somewhat larger profits than the latter. This was true even in 1914. The earnings returned to capital in the shoe merchandising business can not be given, but judging from the gross margin of profit per pair, this return was obviously very liberal.

The best standard for judging whether or not prices of commodities were remunerative, is the percentage of the investment employed in their production that was returned in profits. Judged by this standard, the tanning and shoe manufacturing businesses were highly profitable. There are shown in this report (see p. 27) the investment and earnings of 53 tanning companies. These companies include all classes of tanneries from small ones to very large ones. The investment and earnings of 52 of these companies are shown for the entire period from 1914 to 1917, inclusive. Below is a statement, grouping these 52 companies according to their rates of earnings. They have been divided into four groups. The first group includes those that had net earnings on capital of 20 per cent or

more, the second group includes those showing earnings of from 10 per cent to 20 per cent, the third group includes those that earned less than 10 per cent, and the fourth group includes those whose operations resulted in loss.

Classification of 52 tanning companies according to rates of net earnings on investment.

	1914	1916	1917
Profit of 20 per cent or more	10	37	32
Profit of from 10 to 20 per cent	20	7	19
Profit of less than 10 per cent	20	8	1
Loss	2	.....	.....

About 20 per cent of these 52 tanneries earned over 20 per cent in profits in 1914, 70 per cent of them exceeded 20 per cent in 1916, and 61 per cent exceeded that rate of earnings in 1917. About 40 per cent earned less than 10 per cent in 1914, and only 2 per cent earned less than this in 1917. The operations of only two of these 52 companies resulted in loss in 1914, and none suffered loss in 1916 or 1917.

In like manner as above, 236 companies engaged in the manufacture of shoes are grouped and the results are shown in the following statement:

Classification of 236 shoe manufacturers according to earnings on investment.

	1914	1916	1917
Earnings of 20 per cent or more	60	137	131
Earnings of from 10 to 20 per cent	87	80	70
Earnings of less than 10 per cent	66	16	27
Loss	23	3	8

Nearly 25 per cent of the 236 shoe manufacturers here considered earned more than 20 per cent on their investment in 1914, and 57 per cent earned more than this rate in 1917. In 1914, 27 per cent of them earned less than 10 per cent and many of them very much less than this rate, while in 1917 less than 7 per cent of them earned less than 10 per cent. In 1914, 23 of these 236 companies operated at a loss, while in 1917 only 8 suffered losses from their operations.

The returns on investment to shoe merchants are not known. The percentage they added to the cost of their shoes to arrive at a selling price remained practically the same throughout the entire period, but the application of the percentage of profit to the higher prices paid by them resulted in a much wider margin per pair of shoes sold. These margins were ascertained and are shown at page 106.

The effect of these large profits on the cost of shoes to the consumer is pronounced. Leather is the principal item of cost in the produc-

tion of shoes. The shoe manufacturer includes a profit on this leather in the price he charges the retail merchant for shoes, and the merchant exacts a very high percentage of profit from the consumer. Thus the final purchaser of shoes, who is the consumer, pays the profit the tanner receives on his leather, the profit the shoe manufacturer receives from the shoe merchant, and the profit taken by the merchant. To the extent that these profits are too high, to that extent consumers pay too much. How these cumulative profits affect the price of shoes may be illustrated in the two examples which follow.

In a shoe (No. 478) that cost the manufacturer $3.97 in 1917, the leather cost $2.71. This shoe was sold by the manufacturer for $5.25. The retail shoe merchants made an average profit of not less than 50 per cent. The consumer therefore, paid not less than $7.50 for a pair of these shoes and he more likely paid $8.00. More than 23 per cent of the 52 tanning concerns just shown received more than 35 per cent profit on their leather in 1917. Applying this percentage of profit, the tanner received 71 cents profit on the leather in this shoe. If he had received only 12½ per cent profit, the leather in this shoe would have cost the shoe manufacturer $2.25 instead of $2.71, or 46 cents less. This would have made the shoe cost him $3.51 instead of $3.97. The shoe manufacturer sold this product at $5.25 per pair, or an advance of $1.28 above cost, showing him a profit of approximately 22 per cent. If the shoe manufacturer had received a profit of 12½ per cent on the lower cost, he would have sold it to the merchant for $3.95 instead of $5.25. As already stated, the retail merchant no doubt sold this shoe for not less than $7.50 and made a profit of about 50 per cent. At the same rate of profit he could have sold the lower cost shoe for $6.00. Thus by reducing the profits of the tanner and shoe manufacturer to 12½ per cent, the shoe merchant could have sold the shoe at the same rate of profit and the consumer would have saved $1.50 or 20 per cent. It should be noted that in arriving at this result, the percentage of profit realized by the shoe merchants is still 50 per cent. There might have been a still further reduction if the merchant had been content with a lower rate of profit.

There will now be taken an instance in which the shoe manufacturer made a much smaller rate of profit and a lower rate of return has been allowed the tanner for the leather. A woman's shoe (No. 749) that cost the manufacturer $4.12 to produce in 1917, was sold for $4.41. The leather in this shoe cost $2.34. Assuming that the tanner made a profit of 25 per cent, and more than 42 per cent of the 52 tanning concerns above shown made that much or more, then this leather cost the tanner $1.87. If he had received a profit of 12½ per cent instead of 25 per cent, the leather in this shoe would

have cost the shoe manufacturer $2.10 instead of $2.34, and the cost of the shoe would have been reduced from $4.12 to $3.88. The shoe manufacturer could have sold this shoe at $4.15 instead of $4.41 and would have made the same rate of profit that he did make. The retailer, no doubt, sold this shoe to the consumer for $6.75 and made a profit of a little more than 50 per cent. If he had bought it at the lower price and sold it at a profit of 50 per cent, the consumer would have paid $6.25 and saved 50 cents. The shoe manufacturer realized only 7 per cent profit on this shoe. If he were allowed a profit of 10 per cent, the consumer would still have paid 25 cents less than she did pay for this pair of shoes.

The above instances probably fairly represent the two extremes of profits made by the tanners and the shoe manufacturers as entire classes. These cumulative profits can not be escaped. When they are too high, however, the consumer suffers. When competition is open and free and when conditions are normal, prices are governed by the law of supply and demand. Under ordinary circumstances if that results in very high prices, and consequent large profits to producers, there might be no just ground for complaint. The demand in excess of supply was an important factor in stimulating unduly high prices.

But during the period of the war, even before this country became a participant, general conditions were not normal. Under conditions that could not be controlled, the ordinary relation of demand to supply was so changed as to give the producer an unusual power over the consumer. It is doubtful if the profits made on leather and shoes during the period of the war could be justified under any circumstances. They certainly can not be under those existing immediately prior to and during our participation in the war. The tanners and shoe manufacturers and shoe merchants made no sacrifices of profits until the Government remonstrated and fixed the price of leather. This reduced the profits of the tanners but still left them at a very satisfactory level. These steps were taken primarily to enable the Government itself to procure shoes for its armies at a more reasonable price. Incidentally, the prices of shoes were, for the time being, slightly reduced to the public generally.

O
